Automata
Minimization

- A set C is closed under an operation \cdot iff for any elements $x, y \in C$, $x \cdot y \in C$.
- Examples
 - Let $C = \{L \subseteq \Sigma^* : L \text{ es finite}\}$. The union and the intersection are closed in C , whereas the complement is not.

Automata

DFA
Minimization
and Closure
Operations

Automaton A_1 (not complete)

$$L(A_1) = \{(ab)^n : n \geq 0\} = \{ab\}^*$$

Automaton A_2 (complete). Note that $L(A_2) = L(A_1)$

Automata

DFA
Minimization
and Closure
Operations

Automaton A_3

$$\begin{aligned} L(A_3) &= \{x \in \{a, b\}^* : |x|_a > 0\} = \{a, b\}^* \{a\} \{a, b\}^* = \\ &= \{b\}^* \{a\} \{a, b\}^* \end{aligned}$$

Boolean operations

Intersection

Regular languages are closed under intersection:

Let $L_1, L_2 \in \mathcal{L}_3$, then there exist two automata A_1, A_2 such that $L_1 = L(A_1)$, $L_2 = L(A_2)$, where

$A_i = (Q_i, \Sigma, \delta_i, q_i, F_i), i = 1, 2$

We build $A' = (Q, \Sigma, \delta, q_0, F)$ where:

- $Q = Q_1 \times Q_2$
- $q_0 = [q_1, q_2]$
- $F = F_1 \times F_2$
- $\delta([p_1, p_2], a) = [\delta_1(p_1, a), \delta_2(p_2, a)], p_1 \in Q_1, p_2 \in Q_2, a \in \Sigma$

$$L(A') = L(A_1) \cap L(A_2)$$

Minimization

Automaton for $L(A_1) \cap L(A_3)$.

Boolean operations

Union

Regular languages are closed under **Union**:

Let $L_1, L_2 \in \mathcal{L}_3$, then there exist two *complete* automata

A_1, A_2 such that $L_1 = L(A_1), L_2 = L(A_2)$, where

$A_i = (Q_i, \Sigma, \delta_i, q_i, F_i), i = 1, 2$

We build $A' = (Q, \Sigma, \delta, q_0, F)$ where:

- $Q = Q_1 \times Q_2$
- $q_0 = [q_1, q_2]$
- $F = (F_1 \times Q_2) \cup (Q_1 \times F_2)$
- $\delta([p_1, p_2], a) = [\delta_1(p_1, a), \delta_2(p_2, a)], p_1 \in Q_1, p_2 \in Q_2, a \in \Sigma$

$$L(A') = L(A_1) \cup L(A_2)$$

Let $L \in \mathcal{L}_3$, then there exists an automaton

$A = (Q, \Sigma, \delta, q_0, q_f)$ If $|F| > 1$, A can be modified to have one final state (How?).

We build $A' = (Q, \Sigma, \delta', q_f, q_0)$ where:

$q \in \delta(p, a) \leftrightarrow p \in \delta'(q, a)$.

$$L(A') = L(A^r)$$

Minimization

Regular languages are closed under Star Closure.

Let $L \in \mathcal{L}_3$, then there exists an automaton A such that $L = L(A)$ where $A = (Q, \Sigma, \delta_0, q_0, F)$. We build $A' = (Q', \Sigma, \delta', q_n, F)$ where:

- $Q' = Q \cup \{q_n\}, q_n \notin Q$
- $F = F \cup \{q_n\}$
- $\delta'(p, a) = \delta(p, a)$, for every $p \in Q$ and every $a \in \Sigma$
- $q_n \in \delta'(p, \lambda)$, for every $p \in F$
- $\delta'(q_n, \lambda) = \{q_0\}$

Automata
Minimization

- A DFA $A = (Q, \Sigma, \delta, q_0, F)$ is reachable if for every $q \in Q$ there exists a word $x \in \Sigma^*$ such that $\delta(q_0, x) = q$
- Let $A = (Q, \Sigma, \delta, q_0, F)$ be a complete and reachable DFA. The indistinguishability relation \sim on Q is defined $\forall q, q' \in Q$:
$$(q \sim q' \leftrightarrow \forall x \in \Sigma^* (\delta(q, x) \in F \leftrightarrow \delta(q', x) \in F))$$
- Let $A = (Q, \Sigma, \delta, q_0, F)$ be a complete and reachable DFA and let \sim be the indistinguishability relation. We define the quotient automaton $A / \sim = (Q / \sim, \Sigma, \delta, q_0 / \sim, F / \sim)$ as:
 - $Q / \sim = \{[q]_{\sim} : q \in Q\}$
 - $q_0 / \sim = [q_0]_{\sim}$
 - $F / \sim = \{[q]_{\sim} : q \in F\}$
 - $\delta([q]_{\sim}, a) = [\delta(q, a)]_{\sim}$

Homomorphisms

Automata
Minimization

- Sea $A = (Q, \Sigma, \delta, q_0, F)$ be a complete and reachable DFA and let \sim be the indistinguishability relation. The automaton A/\sim is the minimum DFA accepting $L(A)$
- Let $A = (Q, \Sigma, \delta, q_0, F)$ be a complete and reachable DFA and let $k \geq 0$ be an integer. The k -indistinguishability relation \sim_k is defined:
 $\forall q, q' \in Q : (q \sim_k q' \leftrightarrow$
 $\forall x \in \Sigma^*, |x| \leq k, (\delta(q, x) \in F \leftrightarrow \delta(q', x) \in F))$
- Properties of \sim_k :
 - $\forall k \geq 0, p \sim_{k+1} q \rightarrow p \sim_k q$
 - $\forall k \geq 0, p \sim q \rightarrow p \sim_k q$
 - $\forall k \geq 0, p \sim_{k+1} q \leftrightarrow (p \sim_k q \wedge \forall a \in \Sigma, \delta(p, a) \sim_k \delta(q, a))$

Automata
Minimization

Minimization Algorithm:

- 1. $\pi_0 = \{Q - F, F\}$
- 2. Obtain π_{k+1} from π_k $B(p, \pi_{k+1}) == B(q, \pi_{k+1})$ if and only if
 - $B(p, \pi_k) == B(q, \pi_k)$
 - y For every $a \in \Sigma$, $B(\delta(p, a), \pi_k) == B(\delta(q, a), \pi_k)$
- 3. If π_{k+1} is different from π_k go to 2
