Lemma

- Inductively, a regular expression over Σ is defined:
 - \emptyset denotes the empty language.
 - λ denotes the language $\{\lambda\}$
 - $\forall a \in \Sigma$, a denotes the language $\{a\}$
 - If r and s are regular expressions denoting L_r and L_s :
 - (r) denotes L_r
 - $r + s$ denotes $L_r \cup L_s$
 - rs denotes $L_r L_s$
 - $(r)^*$ denotes L_r^*
 - All the regular expressions are built using the previous steps finitely many times.

■ Let α , β and γ be regular expressions

$$1 \quad \alpha + (\beta + \gamma) = (\alpha + \beta) + \gamma$$

$$2 \quad \alpha(\beta\gamma) = (\alpha\beta)\gamma$$

$$3 \quad \alpha + \beta = \beta + \alpha$$

$$4 \quad \alpha(\beta + \gamma) = (\alpha\beta) + (\alpha\gamma)$$

$$5 \quad (\alpha + \beta)\gamma = (\alpha\gamma) + (\beta\gamma)$$

$$6 \quad \alpha\lambda = \lambda\alpha = \alpha$$

$$7 \quad \alpha + \emptyset = \emptyset + \alpha = \alpha$$

$$8 \quad \alpha\emptyset = \emptyset\alpha = \emptyset$$

$$9 \quad \lambda^* = \lambda$$

$$10 \quad \emptyset^* = \lambda$$

$$11 \quad \alpha^* = \lambda + \alpha\alpha^*$$

$$12 \quad (\alpha^* + \beta^*)^* = (\alpha^*\beta^*)^* = (\alpha + \beta)^*$$

$$13 \quad (\alpha\beta)^*\alpha = \alpha(\beta\alpha)^*$$

$$14 \quad (\alpha^*\beta)^*\alpha^* = (\alpha + \beta)^*$$

$$15 \quad (\alpha^*\beta)^* = (\alpha + \beta)^*\beta + \lambda$$

- Homomorphism
- Reverse

■ Homomorphism

Given a regular expression α and a homomorphism $h : \Sigma_{\alpha} \rightarrow \Delta$, to obtain a regular expression for $h(L(\alpha))$, one has to change every symbol a of α by its image $h(a)$

For example, let us consider $\alpha = a(bb^* + (aa)^*)^*b$ and the homomorphism: $h(a) = 0$ y $h(b) = 11$. The regular expression for $h(L(\alpha))$ is:

$$0(11(11)^* + (00)^*)^*11$$

Arden's
Lemma

■ Reverse

Given a regular expression α , to obtain a regular expression for α^r such that $L(\alpha^r) = (L(\alpha))^r$, we recursively apply the following rules:

- If $\alpha = \emptyset$, $\alpha = \lambda$ or $\alpha = a \in \Sigma$, then $\alpha^r = \alpha$
- If $\alpha = \beta + \gamma$, then $\alpha^r = \beta^r + \gamma^r$
- If $\alpha = \beta\gamma$, then $\alpha^r = \gamma^r\beta^r$
- If $\alpha = \beta^*$, then $\alpha^r = (\beta^r)^*$

For example, let us consider $\alpha = a(b(a + b)^* + (bba)^*)^*b$.
The regular expression for $(L(\alpha))^r$ is:

$$\alpha^r = b((a + b)^*b + (abb)^*)^*a$$

Arden's
Lemma

- A DFA $A = (Q, \Sigma, \delta, q_0, F)$ is *local* if and only if for every $a \in \Sigma$ the set $\{\delta(q, a) : q \in Q\}$ has at most one element.
- If there is no arrow of the form $q \rightarrow q_0$, the automaton is called *standard local*
- A language is local if and only if it is recognized by a standard local automaton.

Arden's
Lemma

- Let α be a regular expression and let n be the number of symbols in α without parenthesis and operation symbols. The linearized expression of α (denoted by $\overline{\alpha}$) is obtained placing a subindex $j \in \{1, \dots, n\}$ to every symbol of α that indicates its position.

Example: Consider

$$\alpha = (a + b)(a^* + ba^* + b^*)^*$$

the linearized expression is

$$\overline{\alpha} = (a_1 + b_2)(a_3^* + b_4a_5^* + b_6^*)^*$$

Syntheses of
FAs from ERs

Position
Automata

Follow
Automaton
Brzozowski's
Algorithm

FA Analysis.
Arden's
Lemma

- If Σ_α and $\Sigma_{\bar{\alpha}}$ are the alphabets of α and $\bar{\alpha}$ respectively, and $h : \Sigma_{\bar{\alpha}}^* \rightarrow \Sigma_\alpha^*$ is a homomorphism that erases the subindexes, then:

$$h(L(\bar{\alpha})) = L(\alpha)$$

- An automaton for $L(\alpha)$ can be obtained:
 - Building an automaton for $L(\bar{\alpha})$ and
 - Removing the subindexes of this automaton (*position automaton*)

- equation with regular expressions: linear equation where both variables and coefficients are regular expressions.

$$X = rX + s$$

- Arden's Lemma: Let $X = rX + s$ be an equation with regular expressions. $X = r^*s$ is a solution for the equation. It is the only solution if $\lambda \notin r$
 - we prove that r^*s is a solution:

$$rX + s \underset{X=r^*s}{=} rr^*s + s = (rr^* + \lambda)s \underset{rr^* + \lambda = r^*}{=} r^*s$$

- If $\lambda \in r$ there is an infinite number of solutions: $\forall t \subseteq \Sigma^*$, $r^*(s + t)$ is a solution:

$$\begin{aligned} X = rX + s &= rr^*(s + t) + s = rr^*s + rr^*t + s = \\ &= (rr^* + \lambda)s + rr^*t \underset{rr^* + \lambda = r^*}{=} r^*s + r^*t \underset{X=r^*(s+t)}{=} X \end{aligned}$$

Arden's
Lemma

- Given a System of equations with regular expressions.:

$$\begin{cases} X_1 = r_{11}X_1 + r_{12}X_2 + \dots + r_{1n}X_n + s_1 \\ X_2 = r_{11}X_1 + r_{12}X_2 + \dots + r_{1n}X_n + s_2 \\ \dots \\ X_n = r_{11}X_1 + r_{12}X_2 + \dots + r_{1n}X_n + s_3 \end{cases}$$

The solution comes through applying Gauss' method, using Arden's Lemma to reduce r.e.

Lemma

- 1: **Input:** Finite Automaton $A = (Q, \Sigma, \delta, q_1, F)$ con $Q = \{q_1, q_2, \dots, q_n\}$
- 2: **Output:** Regular Expression for $L(A)$
- 3: **Metodo:**
- 4: For every state q_i we introduce a variable X_i
- 5: If $q_i \in F$ then we add λ to the right side of the i -th equation
- 6: If $q_j \in \delta(q_i, a)$ then we add the term aX_j to the right side of the i -th equation, with $a \in \Sigma \cup \{\lambda\}$
- 7: Solve the system of equations with regular expressions using Arden's Lemma to reduce r.e.
- 8: Return the r.e. associated to the initial state
- 9: **End Method**
