1. Introduction

We can transform the ER-UML diagram into other formal models.

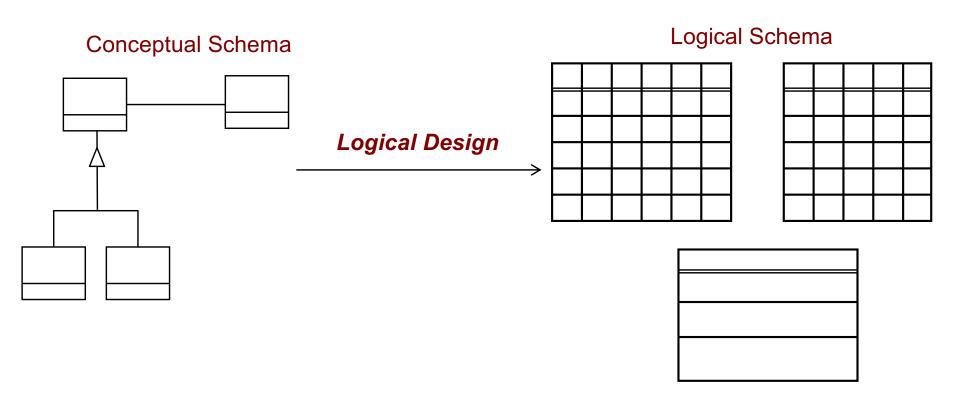

- In software engineering, this can lead to the definition of classes and attributes.
- In databases, we can transform the diagram into other database models, e.g. the relational data model.
 - This transformation is known as logical design.
 - The output will be the relational schema (seen in unit 2)

1. Introduction

Logical Design

Logical Design: Transformation of a conceptual schema, described using a data model (e.g. ER_UML), into another data model (e.g. relational model) which will be the one used by the Database Management System.

- We are going to apply transformations.
- Multiplicities, associations, and constraints are expressed by the use of PK, FK, NNV, and UNI constraints
- Some properties or constraints cannot be represented using these predefined constraints and we will have to add them to the list of general integrity constraints (implemented as assertions, triggers, or program constraints)
- When facing several design options:
 - 1. Choose the resulting schema with the fewest general constraints.
 - 2. If the number of general constraints is similar, choose the solution with the fewest relations.

Methodology to obtain the relational schema

- I. Transform classes into relations
 - 1. Strong classes
 - 2. Weak classes
 - 3. Specialized classes
- II. Transform associations according to their multiplicity
 - 0..1:0..*
 - 0..*:0..*
 - ...
- III. Those properties that can't be represented in the relational schema, will be expressed as a list of integrity constraints

Unit 4.3. Logical Design

1. Introduction

- 2. Class Transformation
 - 2.1. Strong classes
 - 2.2. Weak classes
 - 2.3. Specialization
- 3. Association Transformation
 - 3.1. Non-reflexive associations
 - 3.2. Reflexive associations
 - 3.3. Association with link attributes
 - 3.4. Association within association (association classes)
- 4. Choosing directives for foreign keys
- 5. Examples
- 6. Introduction to Database Normalization

2.1. Strong classes

Α

```
a_0: {id}: t_a_0

a_1: {unique<sub>1</sub>}:{0 ..1}:t_a_1

a_2: {1...1}:t_a_2

a_3: {0..1}:t_a_3

a_4: {1..*}:t_a_4

a_5: {0..*}:t_a_5

a_6: {0..1}:

a_{61}:t_a_{61}

a_{62}:t_a_{62}
```

 $FK:\{a_{\theta}\}\rightarrow A(a_{\theta})$

- "id" to PK
- "unique" to UNI
- "1..x" to NNV
- "x..*" to extra table and FK
 (A one-to-many multiplicity)
- "1..*" (also) to an extra IC.

```
A(\mathbf{a_0}: t_{-a_0}, \mathbf{a_1}: t_{-a_1}, \mathbf{a_2}: t_{-a_2}, \mathbf{a_3}: t_{-a_3}, \ \mathbf{a_{61}}: t_{-a_{61}}, \ \mathbf{a_{62}}: t_{-a_{62}})
PK: \{a_0\}
UNI: \{a_1\}
NNV: \{a_2\}
A4(\mathbf{a_0}: t_{-a_0}, \mathbf{a_4}: t_{-a_4})
PK: \{a_0, a_4\}
FK: \{a_0\} \rightarrow A(a_0)
A5(\mathbf{a_0}: t_{-a_0}, \mathbf{a_5}: t_{-a_5})
PK: \{a_0, a_5\}
IC1: Every value in the attribute <math>a_0 of A must appear in the attribute a_0 of A of A of A of A.
```

9

Example

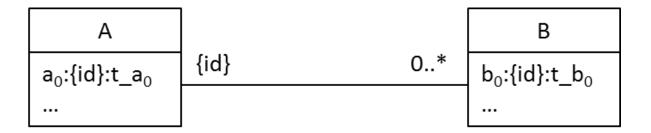

Person

```
SSN:{id}: char
Passport:{unique}:{1..1}:char
Name:{1..1}:
First: char
Second: char
Age: {0..1}:int
Phone:{0..*}:char
```

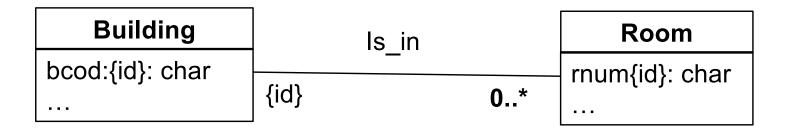

Unit 4.3. Logical Design

- 1. Introduction
- 2. Class Transformation
 - 2.1. Strong classes
 - 2.2. Weak classes
 - 2.3. Specialization
- 3. Association Transformation
 - 3.1. Non-reflexive associations
 - 3.2. Reflexive associations
 - 3.3. Association with link attributes
 - 3.4. Association within association (association classes)
- 4. Choosing directives for foreign keys
- 5. Examples
- 6. Introduction to Database Normalization

2.2. Weak classes

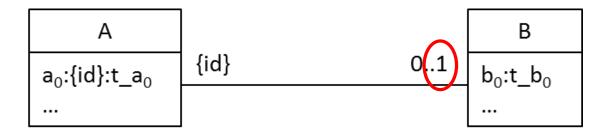

```
A(\mathbf{a_0}: \mathbf{t_a_0}, \dots)
PK: \{a_0\}
B(\mathbf{b_0}: \mathbf{t_b_0}, \mathbf{a_0}: \mathbf{t_a_0}, \dots)
PK: \{a_0, b_0\}
FK: \{a_0\} \rightarrow A(a_0)
```

```
Building(bcod:char,...)
    PK:{bcod}

Room(rnum:char, bcod:char, ...)
    PK:{rnum, bcod}
    FK:{bcod}→ Building
```

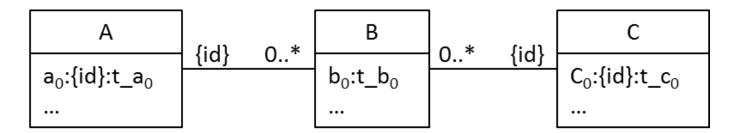

A(
$$a_0$$
: t_a_0 ,...)
PK: $\{a_0\}$
B(b_0 : t_b_0 , a_0 : t_a_0 ,...)
PK: $\{a_0\}$
FK: $\{a_0\} \rightarrow A(a_0)$

 Building
 Is_in
 Auditorium

 bcod:{id}: char
 {id}
 0..1
 ...

```
Building(bcod: char,...)
    PK:{bcod}

Auditorium(bcod: char, capacity: int, ...)
    PK:{bcod}
    FK:{bcod} → Building
```

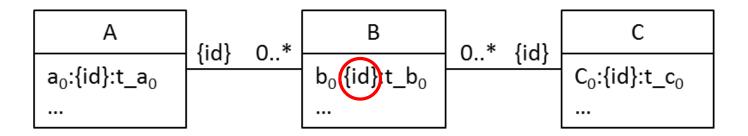

A(
$$a_0$$
:t_ a_0 ,...)
PK:{ a_0 }
C(c_0 :t_ c_0 ,...)
PK:{ c_0 }
B(a_0 :t_ a_0 , c_0 :t_ c_0 , b_0 :t_ b_0 ,...)
PK:{ a_0 , c_0 }
FK:{ a_0 } \rightarrow A(a_0)
FK:{ c_0 } \rightarrow C(c_0)

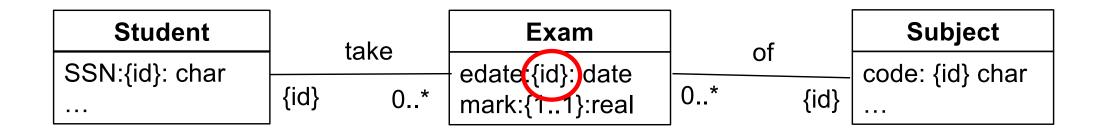

```
Student(SSN:char,...)
    PK:{SSN}

Subject (code: char, ...)
    PK:{code}

Exam (SSN: char, code: char, grade: real, ...)
    PK:{SSN,code}
    FK:{SSN}→ Student
    FK:{code}→ Subject
    NNV:{grade}
```

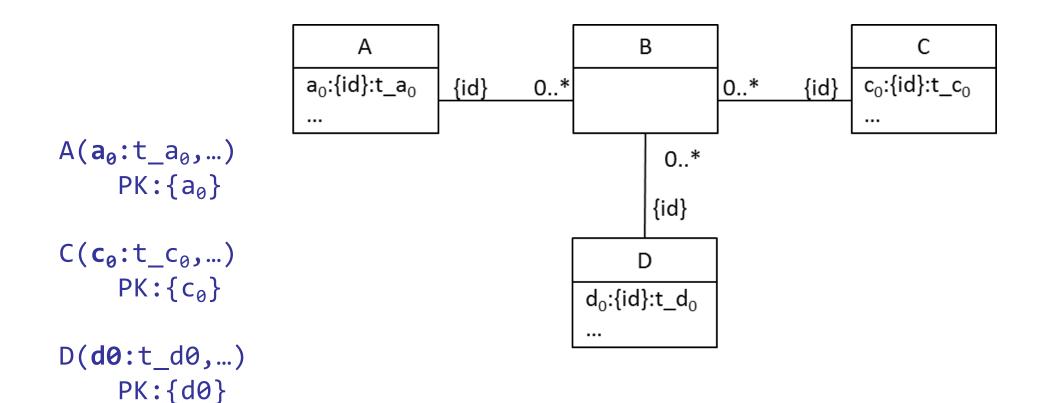

A(
$$a_0$$
:t_ a_0 ,...)
PK:{ a_0 }
C(c_0 :t_ c_0 ,...)
PK:{ c_0 }
B(a_0 :t_ a_0 , c_0 :t_ c_0 , b_0 :t_ b_0 ,...)
PK:{ a_0 , c_0 , b_0 }
FK:{ a_0 } \rightarrow A(a_0)
FK:{ c_0 } \rightarrow C(c_0)

```
Student(SSN: char,...)
    PK:{SSN}

Subject (code: char, ...)
    PK:{code}

Exam (SSN: char, code: char, edate: date, mark: real, ...)
    PK:{SSN, code, edate}
    FK:{SSN}→ Student
    FK:{code}→ Subject
    NNV:{mark}
```

B(a0:t_a0, c0:t_c0, d0:t_d0) PK:{a₀,c₀,d₀} FK:{a₀} \rightarrow A(a₀) FK:{c₀} \rightarrow C(c₀) FK:{d₀} \rightarrow D(d₀)

Example:

A: Piece

C: Provider

D: Project

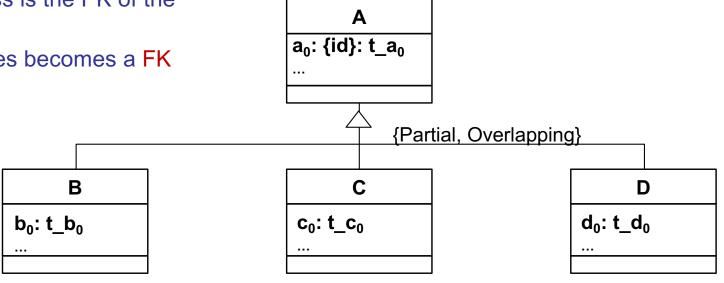

B: Supply

Unit 4.3. Logical Design

- 1. Introduction
- 2. Class Transformation
 - 2.1. Strong classes
 - 2.2. Weak classes
 - 2.3. Specialization
- 3. Association Transformation
 - 3.1. Non-reflexive associations
 - 3.2. Reflexive associations
 - 3.3. Association with link attributes
 - 3.4. Association within association (association classes)
- 4. Choosing directives for foreign keys
- 5. Examples
- 6. Introduction to Database Normalization

2.3. Specialization

- The PK of the superclass is the PK of the subclasses.
- The PK of the subclasses becomes a FK to the superclass

$$A(\mathbf{a_0}: t_{a_0}, ...) \qquad C(\mathbf{a_0}: t_{a_0}, \mathbf{c_0}: t_{c_0}, ...) \\ PK: \{a_0\} \qquad PK: \{a_0\} \\ FK: \{a_0\} \rightarrow A(a_0)$$

$$B(\mathbf{a_0}: t_{a_0}, \mathbf{b_0}: t_{b_0}, ...) \qquad D(\mathbf{a_0}: t_{a_0}, \mathbf{d_0}: t_{d_0}, ...) \\ PK: \{a_0\} \qquad PK: \{a_0\} \\ FK: \{a_0\} \rightarrow A(a_0) \qquad FK: \{a_0\} \rightarrow A(a_0)$$

IC Total:

Every value which appears in the attribute a_0 of A must appear in the attribute a_0 of B, C, or D.

IC Disjoint:

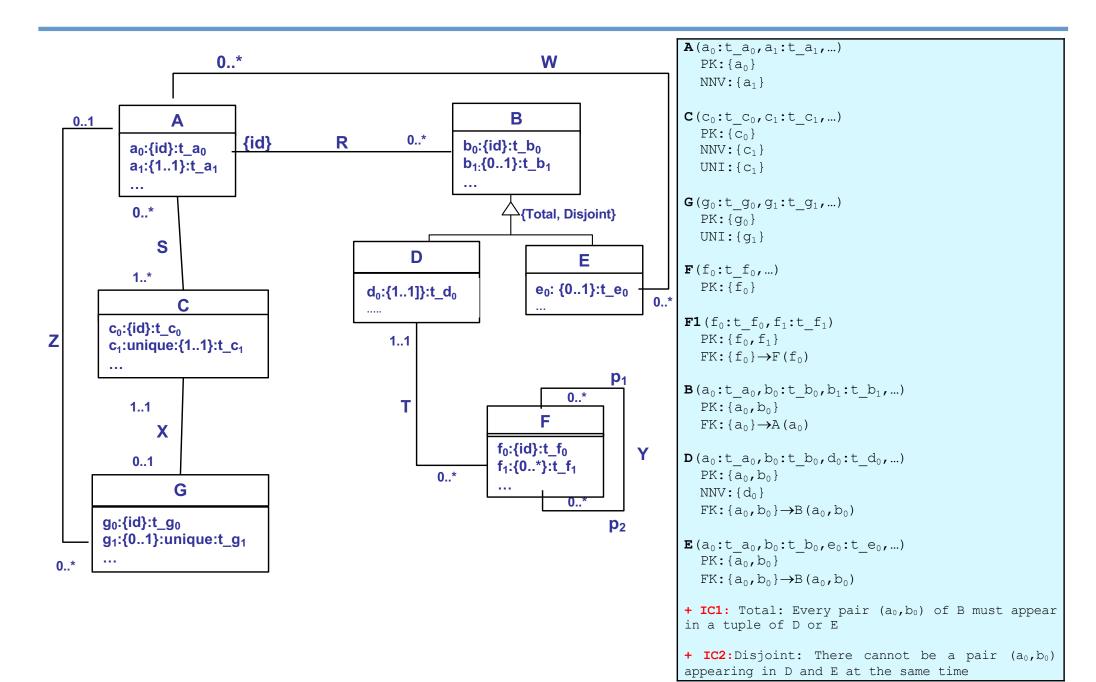

There cannot be the same value in the attribute a_0 of B and the attribute a_0 of C; nor for a_0 of B and a_0 of D.

(alternative wording: A value a_0 of A cannot appear in more than one attribute a_0 of B, C, or D).

$$A(a_0:t_a_0,...)$$
 $PK:\{a_0\}$
 $B(a_0:t_a_0,b_0:t_b_0,...)$
 $PK:\{a_0\}$
 $FK:\{a_0\} \rightarrow A(a_0)$

$$C(a_0:t_a_0, c_0:t_c_0,...)$$
 $PK:\{a_0\}$
 $FK:\{a_0\} \rightarrow A(a_0)$
 $D(a_0:t_a_0, d_0:t_d_0,...)$
 $PK:\{a_0\}$
 $FK:\{a_0\} \rightarrow A(a_0)$

Exercise 1a: Transform the classes

Unit 4.3. Logical Design

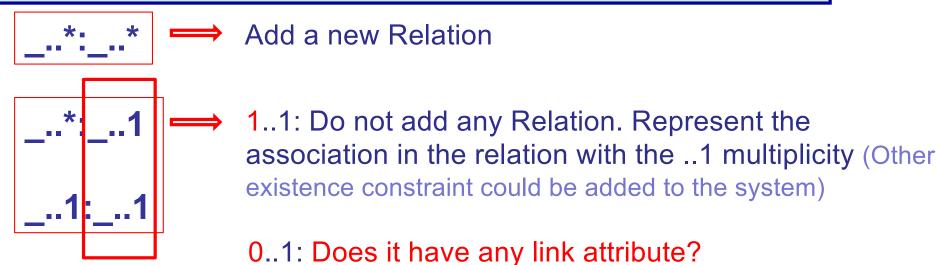

- 1. Introduction
- 2. Class Transformation
 - 2.1. Strong classes
 - 2.2. Weak classes
 - 2.3. Specialization

3. Association Transformation

- 3.1. Non-reflexive associations
- 3.2. Reflexive associations
- 3.3. Association with link attributes
- 3.4. Association within association (association classes)
- 4. Choosing directives for foreign keys
- 5. Examples
- 6. Introduction to Database Normalization

Methodology to obtain the relational schema

- I. Transform the classes into relations
 - 1. Strong classes
 - 2. Weak classes
 - 3. Specialized classes
- II. Transform the associations according to their multiplicity:

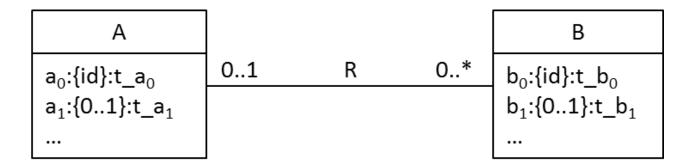

Yes: Add a new Relation

No: Do not add any Relation. Represent the association in the relation with 0..1 multiplicity

III. Those properties that can't be represented in the relational schema, will be expressed in a list of integrity constraints

0..1:0..*

Association

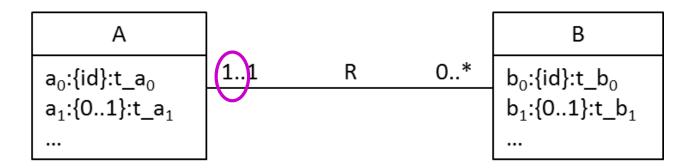

```
A(a_0:t_a_0,a_1:t_a_1,...)
PK:\{a_0\}
B(b_0:t_b_0,b_1:t_b_1,...,a_0:t_a_0)
PK:\{b_0\}
FK:\{a_0\} \rightarrow A(a_0)
```

Example:

A: Person

B: Car

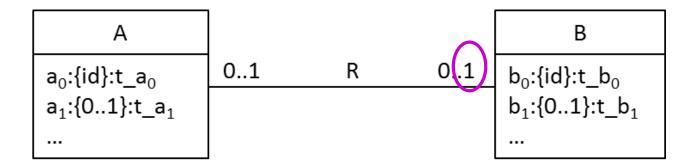

R: buys

```
A(a_0:t_a_0, a_1:t_a_1,...)
PK:\{a_0\}
B(b_0:t_b_0, b_1:t_b_1,..., a_0:t_a_0)
PK:\{b_0\}
FK:\{a_0\} \rightarrow A(a_0)
NNV:\{a_0\}
```

Example:

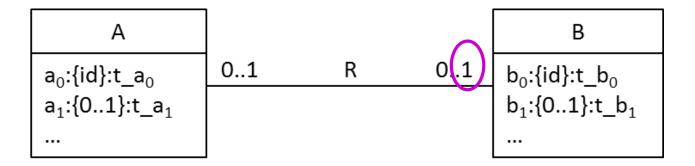

A: Person B: Car R: owns

```
Option 1

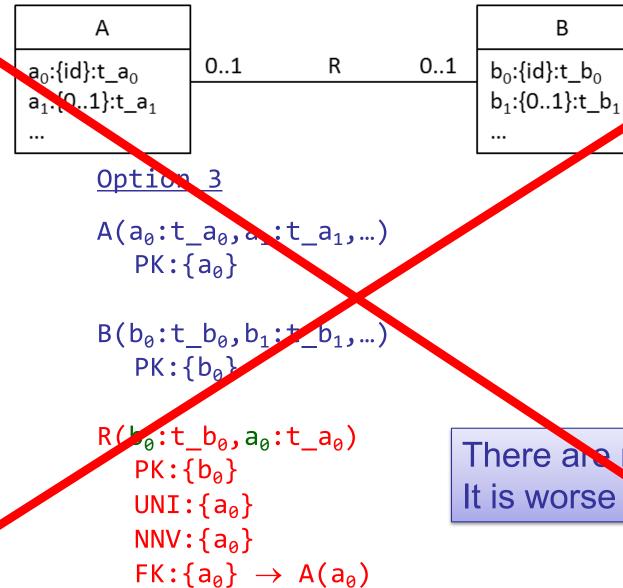

A(a<sub>0</sub>:t_a<sub>0</sub>,a<sub>1</sub>:t_a<sub>1</sub>,...)
    PK:{a<sub>0</sub>}

B(b<sub>0</sub>:t_b<sub>0</sub>,b<sub>1</sub>:t_b<sub>1</sub>,...,a<sub>0</sub>:t_a<sub>0</sub>)
    PK:{b<sub>0</sub>}
    UNI:{a<sub>0</sub>}
    FK:{a<sub>0</sub>} → A(a<sub>0</sub>)
```

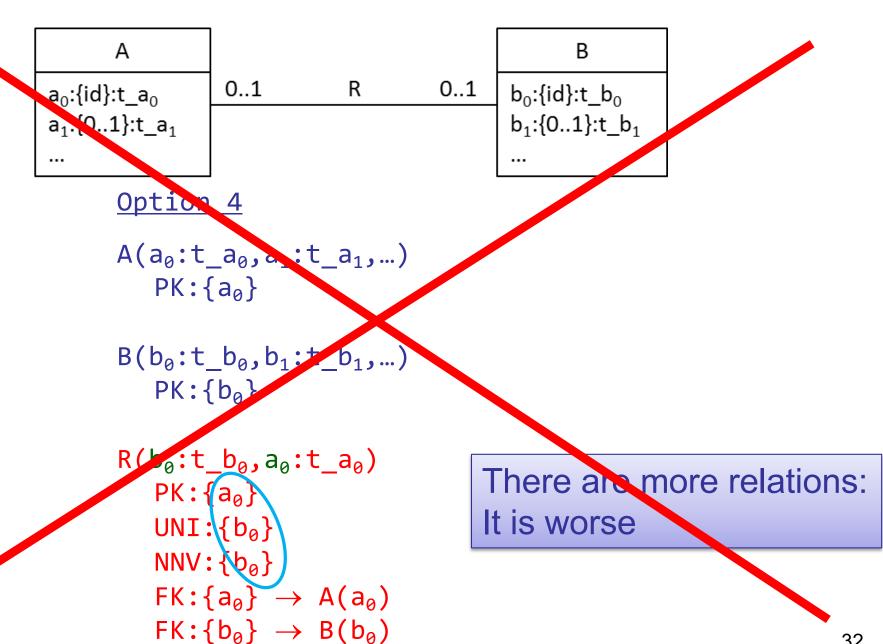

Option 2

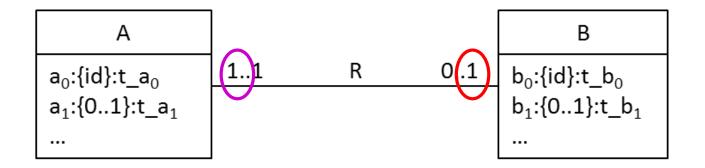

```
A(a_0:t_a_0,a_1:t_a_1,...,b_0:t_b_0)
PK:\{a_0\}
UNI:\{b_0\}
FK:\{b_0\} \rightarrow B(b_0)
B(b_0:t_b_0,b_1:t_b_1,...)
PK:\{b_0\}
```

 $FK:\{b_{\theta}\}\rightarrow B(b_{\theta})$

There are more relations: It is worse

```
A(a_0:t_a_0,a_1:t_a_1,...)
PK:\{a_0\}

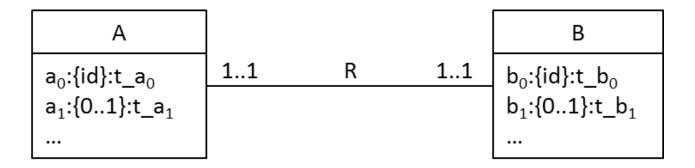

B(b_0:t_b_0,b_1:t_b_1,...,a_0:t_a_0)
PK:\{b_0\}
UNI:\{a_0\}
NNV:\{a_0\}
FK:\{a_0\} \rightarrow A(a_0)
```

Example:

A: Seat

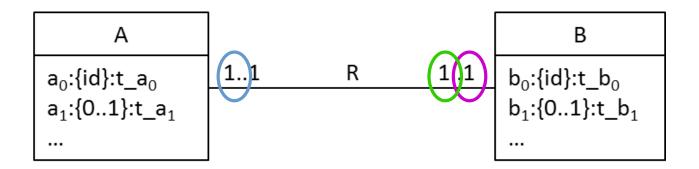

B: Passenger

(in a plane)

```
Option 1
A-B(a<sub>0</sub>:t_a<sub>0</sub>,a<sub>1</sub>:t_a<sub>1</sub>,...,b<sub>0</sub>:t_b<sub>0</sub>,b<sub>1</sub>:t_b<sub>1</sub>,...)
    PK:{a<sub>0</sub>}
    UNI:{b<sub>0</sub>}
    NNV:{b<sub>0</sub>}
```

A-B objects are sometimes more complex to be manipulated

Option 2

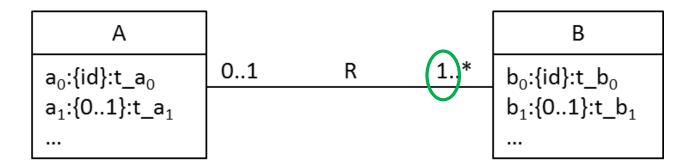

$$A(a_0:t_a_0,a_1:t_a_1,...)$$
 $PK:\{a_0\}$
 $FK:\{a_0\} \rightarrow B(a_0)$

This FK is possible because a₀ in B has Uniqueness constraint

$$B(b_0:t_b_0,b_1:t_b_1,...,a_0:t_a_0)$$
 $PK:\{b_0\}$
 $UNI:\{a_0\}$
 $NNV:\{a_0\}$
 $FK:\{a_0\} \rightarrow A(a_0)$

Sometimes it is a better option

0..1: 1..* Association

$$A(a_0:t_a_0,a_1:t_a_1,...)$$
 $PK:\{a_0\}$
 $B(b_0:t_b_0,b_1:t_b_1,...,a_0:t_a_0)$
 $PK:\{b_0\}$
 $FK:\{a_0\} \rightarrow A(a_0)$

IC1: Every value in a_0 of A must appear in a_0 of B.

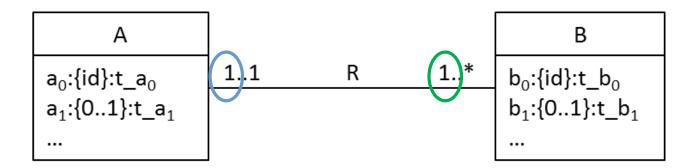

Example:

A: Company

B: Worker

R: has

1..1: 1..* Association

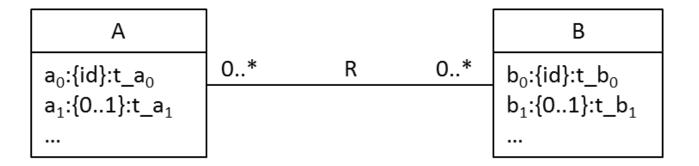

```
A(a_0:t_a_0, a_1:t_a_1,...)
PK:\{a_0\}
B(b_0:t_b_0, b_1:t_b_1,..., a_0:t_a_0)
PK:\{b_0\}
FK:\{a_0\} \rightarrow A(a_0)
NNV:\{a_0\}
```

IC1: Every value in a_0 of A must appear in a_0 of B.

0..*: 0..*

Association

PK:
$$\{a_0\}$$

B(b_0 : t_b_0 , b_1 : t_b_1 ,...)

PK: $\{b_0\}$

R(a_0 : t_a_0 , b_0 : t_b_0)

PK: $\{a_0$, $b_0\}$

FK: $\{a_0\} \to A(a_0)$

FK: $\{b_0\} \to B(b_0)$

 $A(a_0:t_a_0,a_1:t_a_1,...)$

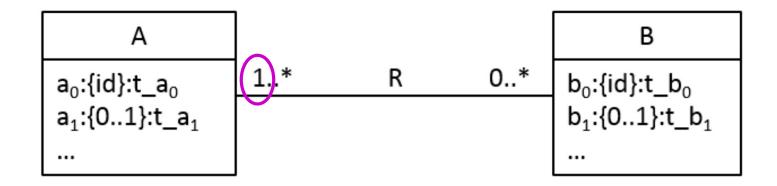

Example:

A: Book

B: Person

R: has_as_author

1..*: 0..* Association

```
A(a_0:t_a_0, a_1:t_a_1,...)

PK:\{a_0\}

B(b_0:t_b_0, b_1:t_b_1,...)

PK:\{b_0\}

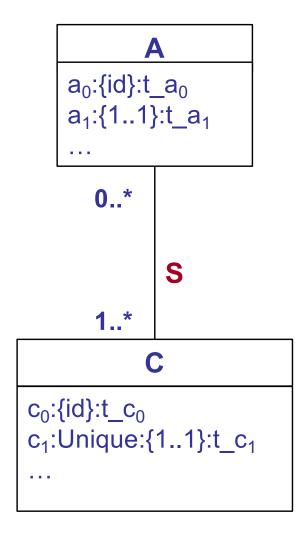

R(a_0:t_a_0, b_0:t_b_0)

PK:\{a_0\} \to A(a_0)

FK:\{b_0\} \to B(b_0)
```

IC1: Every value in b_0 of B must appear in b_0 of R.

Exercise 1b. Transform the association

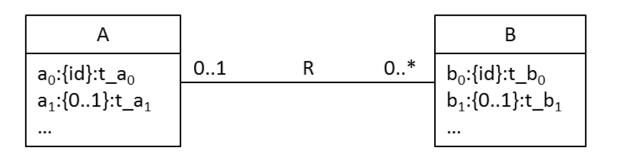

```
A(a_0:t a_0,a_1:t_a_1,...)
 PK: \{a_0\}
 NNV: \{a_1\}
C(c_0:t c_0, c_1:t c_1, ...)
 PK: \{c_0\}
 NNV: \{C_1\}
 UNI: \{c_1\}
S(a_0:t_a_0,c_0:t_c_0)
 PK: \{a_0, c_0\}
 FK: \{a_0\} \rightarrow A(a_0)
 FK: \{c_0\} \rightarrow C(c_0)
IC3: Existence constraint of A
in S: Every value in a_0 of A
must appear in a_0 of S.
```

- 4. Choosing directives for foreign keys
- 5. Examples
- 6. Introduction to Database Normalization

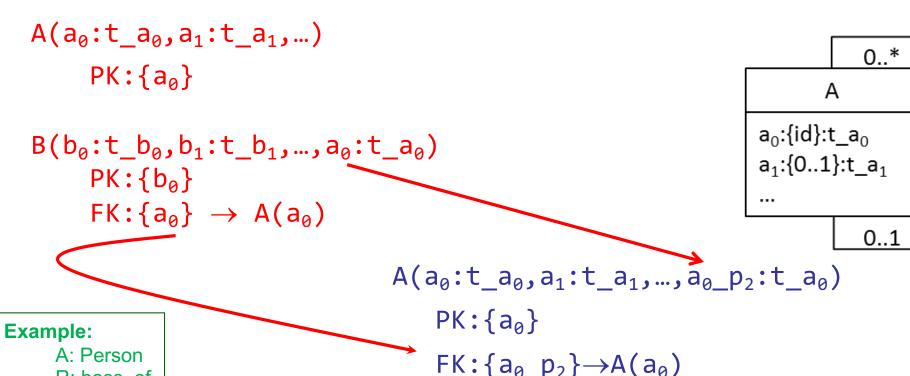

0..1: 0..* Reflexive association

Reflexive associations are handled as any other binary association

R: boss of

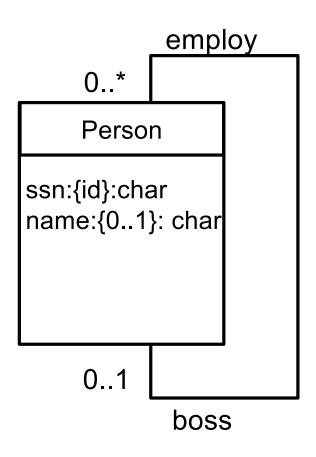

a ₀	a ₁	•••	a ₀ _p ₂
1	b	•••	
2	r	•••	1
3	n	•••	2
4	m		1

 p_1

 p_2

0..1:0..* Reflexive association

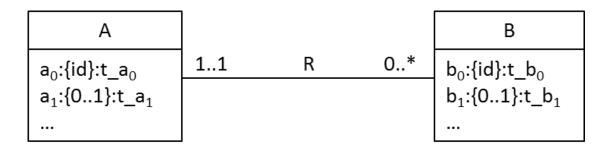

```
Person (ssn:varchar(8),name:varchar(20),boss:varchar(8))
    PK:{ssn}
    FK:{boss}→Person(ssn)
```

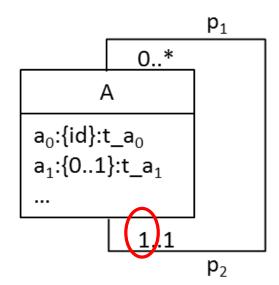

0..1: 0..1 Reflexive association

1..1: 0..* Reflexive association

```
A(a_0:t_a_0,a_1:t_a_1,...)
PK:\{a_0\}
B(b_0:t_b_0,b_1:t_b_1,...,a_0:t_a_0)
PK:\{b_0\}
FK:\{a_0\} \rightarrow A(a_0)
NNV:\{a_0\}
```

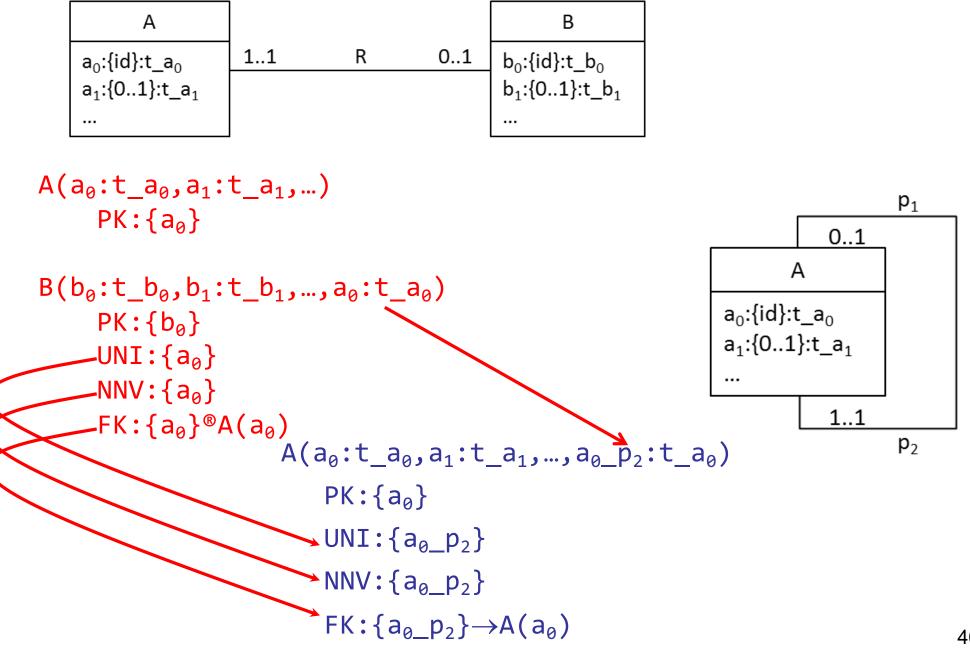

A(a_0 :t_ a_0 , a_1 :t_ a_1 ,..., a_0 _ p_2 :t_ a_0)

PK:{ a_0 }

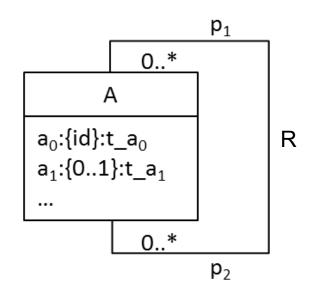

FK:{ a_0 _ p_2 } \rightarrow A(a_0)

NNV:{ a_0 _ p_2 }

0..1: 1..1 Reflexive association

0..*: 0..* Reflexive association

```
A(a_0:t_a_0, a_1:t_a_1,...)

PK:{a_0}

R(a_0_p_1:t_a_0, a_0_p_2:t_a_0)

PK:{a_0_p_1, a_0_p_2}

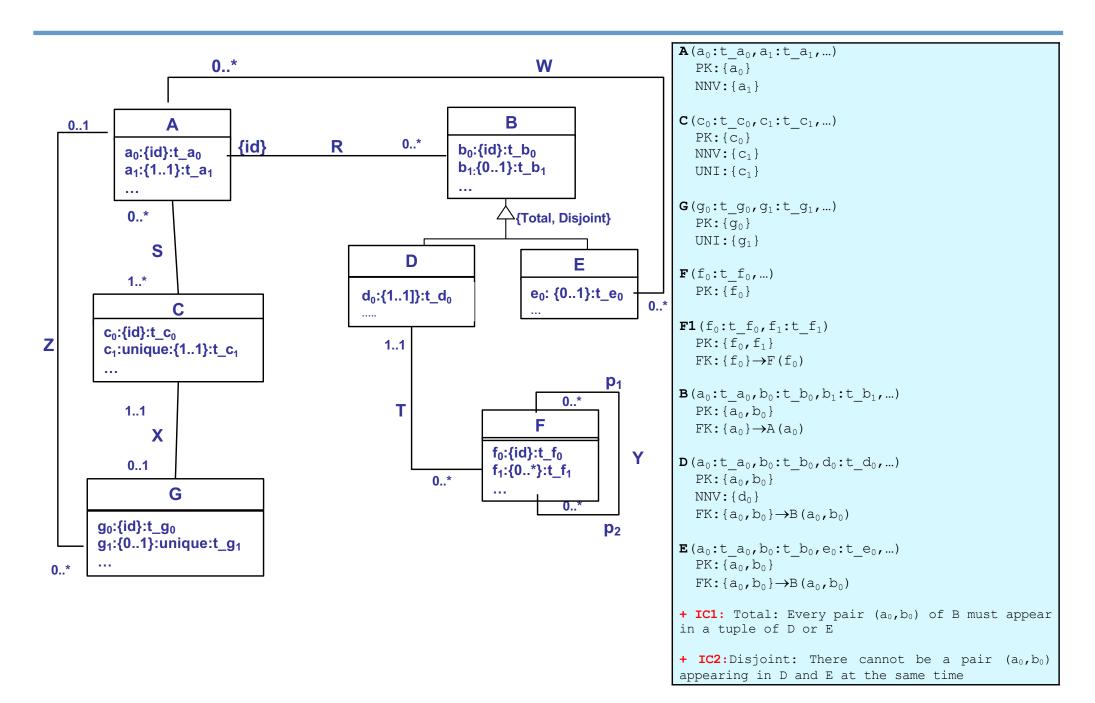

FK:{a_0_p_1}\rightarrowA(a_0)

FK:{a_0_p_2}\rightarrowA(a_0)
```

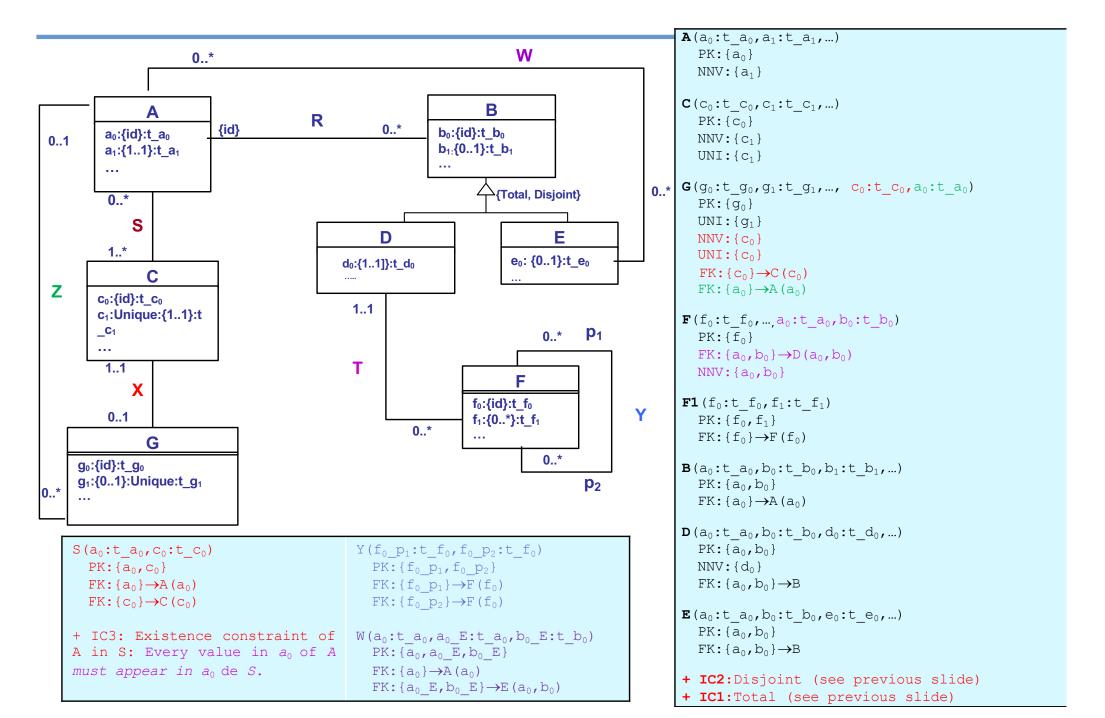

Example:

A: Country R: Borders

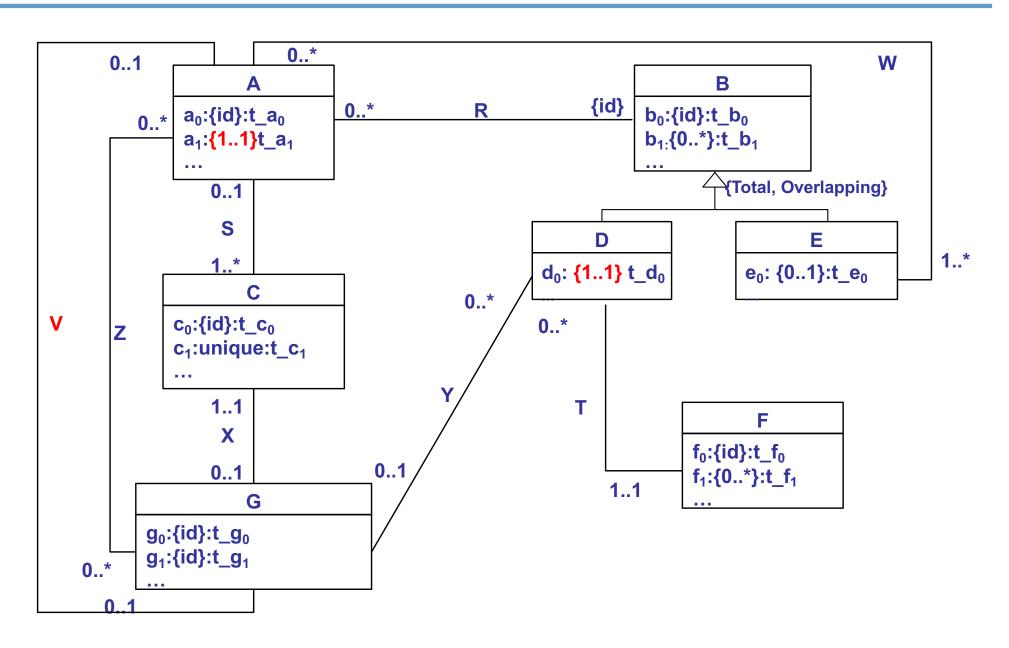

Exercise 1c. Transform the associations

Exercise 1c. Transform the associations

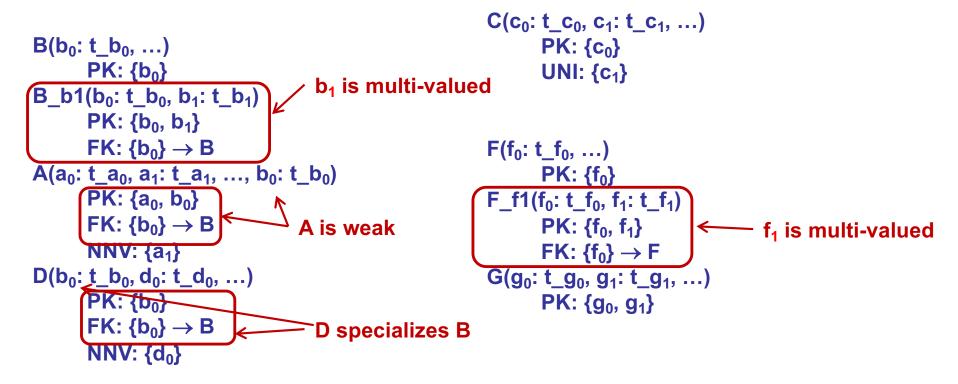

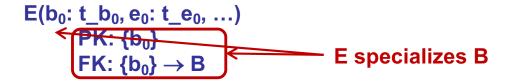

Exercise 2

Exercise 2

Class transformation:

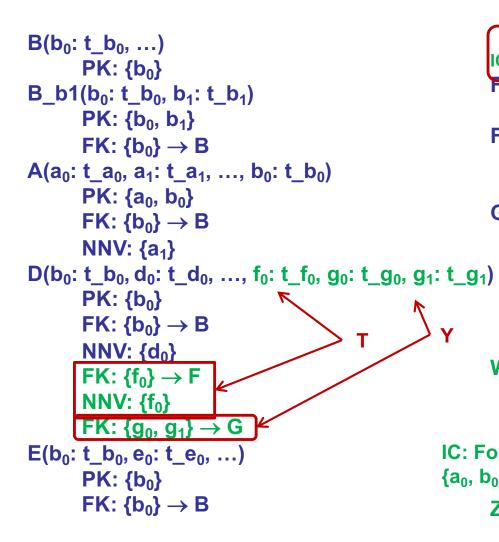

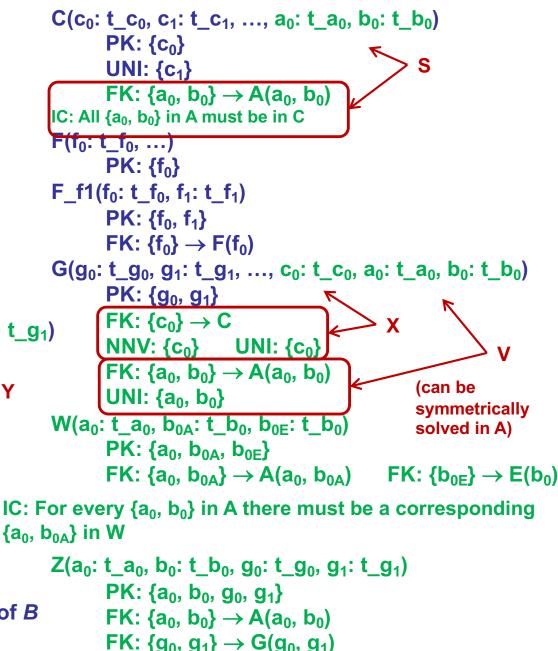

IC_{Total}: "Every value which appears in b_0 of B must appear in b_0 of D or E".

Exercise 2

Association transformation:

IC_{Total}: "Every value which appears in b_0 of B must appear in b_0 of D or E".

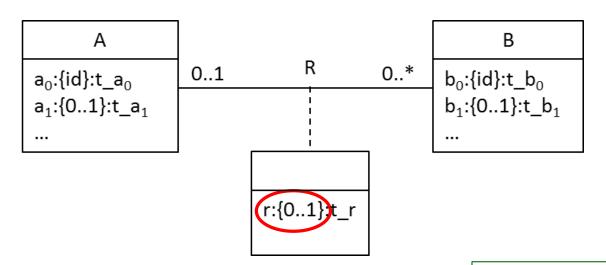

Unit 4.3. Logical Design

- 1. Introduction
- 2. Class Transformation
 - 2.1. Strong classes
 - 2.2. Weak classes
 - 2.3. Specialization
- 3. Association Transformation
 - 3.1. Non-reflexive associations
 - 3.2. Reflexive associations
 - 3.3. Association with link attributes
 - 3.4. Association within association (association classes)
- 4. Choosing directives for foreign keys
- 5. Examples
- 6. Introduction to Database Normalization

Associations with link attributes

- The link attributes are added to the table where the association is represented.
- When link attributes are presented, the transformation schemas shown in the previous sections could be wrong:
 - Add integrity constraints (I. C.)
 - Add new tables

```
A(a_0:t_a_0,a_1:t_a_1,...)
PK:\{a_0\}
B(b_0:t_b_0,b_1:t_b_1,...,a_0:t_a_0,r:t_r)
PK:\{b_0\}
FK:\{a_0\}\rightarrow A(a_0)
```

Example:

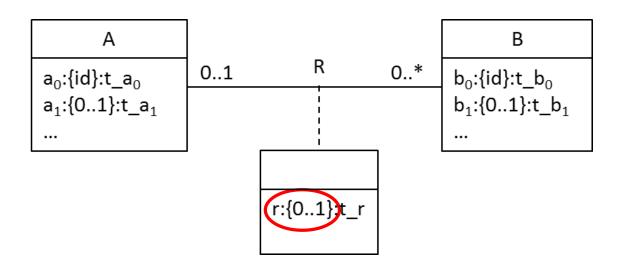

A: Company

B: Person

R: working_for

r: salary

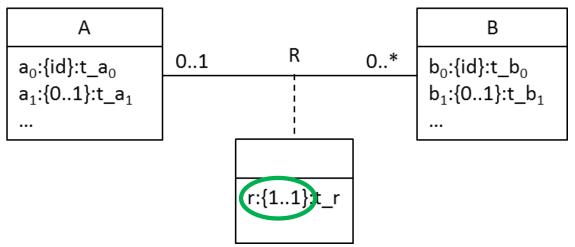

IC1: There can't be a tuple in B where a_0 is NULL and r is not null

```
B(b_0:t b_0,b_1:t b_1,...)
A(a_0:t a_0,a_1:t a_1,...)
         PK: \{a_0\}
                                                 PK: \{b_0\}
R(b_0:t_b_0,a_0:t_a_0,r:t_r)
         PK: \{b_0\}
         NNV: \{a_0\}
         FK: \{a_0\} \rightarrow A(a_0)
         FK: \{b_0\} \rightarrow B(b_0)
```

Better solution:

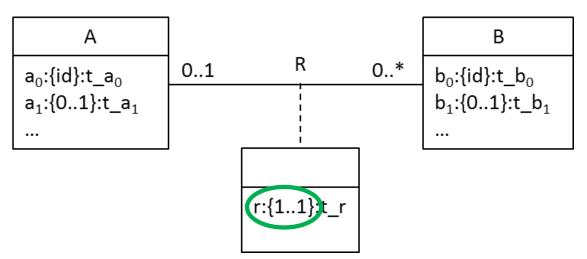

There is no general constraint

```
A(a_0:t_a_0,a_1:t_a_1,...)
PK:\{a_0\}
B(b_0:t_b_0,b_1:t_b_1,...,a_0:t_a_0,r:t_r)
PK:\{b_0\}
FK:\{a_0\}\rightarrow A(a_0)
```

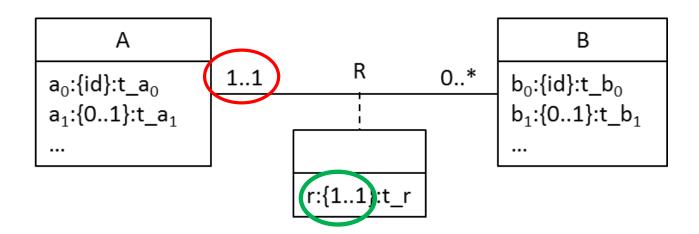

It can be improved

IC1: There can't exist a tuple in B where a_0 is null and r is not null, or vice versa.

```
A(a_0:t_a_0,a_1:t_a_1,...)
                                              B(b_0:t b_0,b_1:t b_1,...)
                                                        PK: \{b_0\}
       PK: \{a_0\}
R(b_0:t_b_0,a_0:t_a_0,r:t_r)
       PK: \{b_0\}
       NNV: \{a_0\}
       NNV: {r}
       FK: \{a_0\} \rightarrow A(a_0)
                                       Better solution
       FK: \{b_0\} \rightarrow B(b_0)
```

There is no integrity constraint.

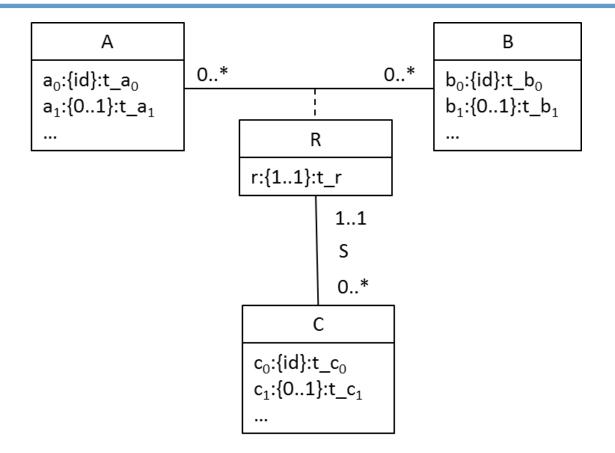

```
A(a_0:t_a_0,a_1:t_a_1,...)
PK:\{a_0\}
B(b_0:t_b_0,b_1:t_b_1,...,a_0:t_a_0,r:t_r)
PK:\{b_0\}
NNV:\{a_0\}
NNV:\{r\}
FK:\{a_0\}\rightarrow A
```

- 4. Choosing directives for foreign keys
- 5. Examples
- 6. Introduction to Database Normalization

Choosing directives for foreign keys

We saw in Unit 1 that foreign keys can be defined with some directives that restore the consistency:

- NO ACTION: The operation is not allowed if it violates the foreign key constraint.
- 2. DELETE/UPDATE SET TO NULLS: The value on the referring table is set to nulls.
- 3. DELETE/UPDATE CASCADE: The row/value on the referring table is deleted/updated.
- Choosing one of them depends on the problem at hand.
- We need to find the one that better fits the meaning of the association.
- Some DBMS do not implement some of these directives

Choosing directives for foreign keys

On UPDATE

It is recommended, as a general rule, to use "ON UPDATE CASCADE".

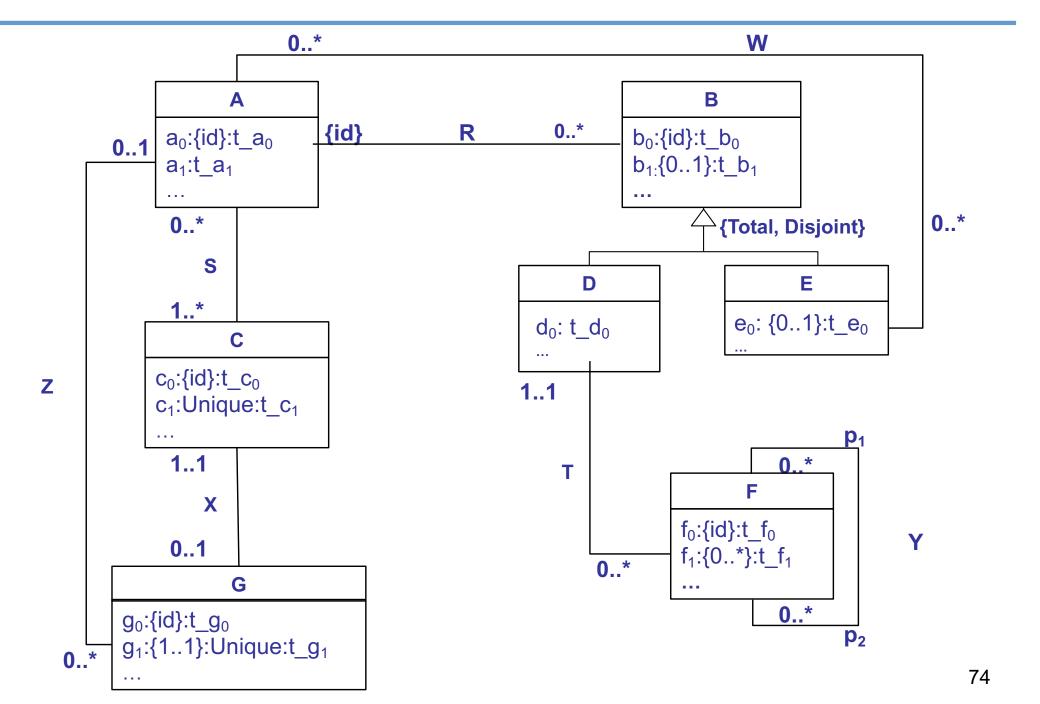

On DELETE

- If the value of the referring table has a NNV constraint, then SET TO NULL makes no sense (it is like NO ACTION).
- For multi-valued attributes {0/1...*}, which lead to an extra table, any deletion in the parent table will require a CASCADE deletion in the child table.
- If there is a 1 to 1 correspondence (e.g. existence), then it may be convenient to use **SET TO NULLS** or **CASCADE**, as the NO ACTION case may lead to the impossibility of deletion (without transactions).
- In specializations, SET TO NULLS cannot be done as the subclass primary key depends on the primary key of the superclass.
- In *total* specializations, NO ACTION may be problematic, as the constraint ensuring totality will be violated.

- 4. Choosing directives for foreign keys
- 5. Examples
- 6. Introduction to Database Normalization

6. Introduction to Database normalization

Normalization

Technique for producing a set of relations with desirable properties dividing some relations into other smaller ones.

Some problems solved by normalization

- Some attributes might be redundant, because of functional dependencies, which may be direct or transitive.
- Bad choices of the primary key from the candidate keys

There are several **normal forms**: 1NF, 2NF, 3NF, BCNF, 4NF, 5NF, ... but we will only study 1NF, 2NF and 3NF.

Functional dependencies

A **functional dependency** (FD) between two sets of attributes X and Y of a relation R, where X <> Y, denoted $X \rightarrow Y$ ("X determines Y", or "Y functionally depends on X^1 ") specifies the following constraint in the real world:

Given two tuples t1 and t2 of R, if the values of X for t1 and t2 are equal then the values of Y for t1 and t2 are also equal (each value of X is associated with exactly one value of Y).

Example 1:

R (name: char, street: char, zip_code: char, city: char)
zip code → city

If we know the *zip_code*, we can infer the city.

This redundancy may lead to inconsistencies

Examples of functional dependencies

Example 2:

```
Wrote (ssn: char(4), name: varchar(50), ISBN: char(25), title: varchar(50), euros: float)
```

PK: {ssn, ISBN}

meaning that the writer with id "ssn" and name "name" has written a book with "ISBN" and "title" and has received "euros" as royalties.

Some functional dependencies:

```
\{ ssn \} \rightarrow \{ name \}
                                                                       { ISBN, name } \rightarrow { title }
\{ ssn, ISBN \} \rightarrow \{ name \} \}
                                                                       { ISBN, ssn, name } \rightarrow { title }
\{ ssn, title \} \rightarrow \{ name \}
                                                                       { ISBN, ssn, euros } \rightarrow { title }
\{ ssn, euros \} \rightarrow \{ name \}
                                                                       { ISBN, name, euros } \rightarrow { title }
{ ssn, ISBN, title } \rightarrow { name }
                                                                       \{ ssn, ISBN \} \rightarrow \{ euros \}
\{ ssn, ISBN, euros \} \rightarrow \{ name \} 
                                                                       \{ ssn, ISBN, name \} \rightarrow \{ euros \}
\{ ssn, ISBN, title, euros \} \rightarrow \{ name \} 
                                                                       \{ ssn, ISBN, title \} \rightarrow \{ euros \}
\{ ISBN \} \rightarrow \{ title \}
                                                                       \{ ssn, ISBN, name, title \} \rightarrow \{ euros \}
{ ISBN, ssn } \rightarrow { title }
                                                                       \{ ssn, ISBN \} \rightarrow \{ title, name \}
{ ISBN, euros } \rightarrow { title }
```

92

Full functional dependency

A Functional Dependency $X \rightarrow Y$ is a **full functional dependency (FFD)** if removal of any attribute A_i from X means that the dependency does not hold any more. That is, $\forall A_i / A_i \in X$, Y doesn't functionally depend on $(X - \{A_i\})$.

Example 2:

```
Wrote (ssn: char(4), name: varchar(50), ISBN: char(25), title: varchar(50), euros: float)
PK: {ssn, ISBN}
```

Set of full functional dependencies:

```
\{ ssn \} \rightarrow \{ name \}
\{ ISBN \} \rightarrow \{ title \}
\{ ssn, ISBN \} \rightarrow \{ euros \}
```

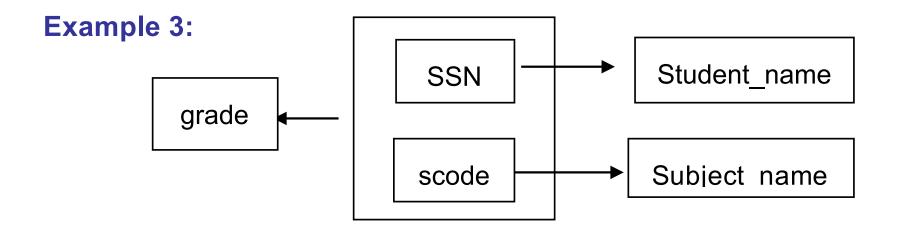

Note that one book could have more than one author

Functional dependencies Diagram

A set of Functional Dependencies for a data model can be represented in a **Functional Dependency Diagram**

In a Functional Dependency Diagram each attribute is shown in a rectangle, and an arrow indicates the direction of the dependency between two attributes.

We are going to represent only full functional dependencies.

Key of a relation

Key of a relation

Set of attributes that is **PK** (*Primary Key*) **or** has **uniqueness** constraint.

For every key in a relation, every attribute subset depends on that key.

Prime attribute

Any attribute that belongs to any key of R.

Example 2:

```
Wrote (ssn: char(4), name: varchar(50), ISBN: char(25), title: varchar(50), euros: float)

PK: \{ssn, ISBN\}

\{ssn, ISBN\} \rightarrow \{ name \} \}

\{ssn, ISBN\} \rightarrow \{ title \} \}

\{ssn, ISBN\} \rightarrow \{ euros \} \}

\{ssn, ISBN\} \rightarrow \{ title, name \}
```

1st Normal Form

A relation is in 1NF if all its attributes are atomic (scalar, i.e. simple and indivisible).

Problem of relations which are not in 1NF:

We must use operators for complex data: lists, sets, records...

Set

Example 4:

Provider PK: {vcod}

vcod	name	telephone	address
V1	Pepe	(96 3233258, 964 523844, 979 568987, 987 456123)	Paz 7, Valencia
V2	Juan	(96 3852741, 910 147258)	Eolo 3, Castellón
V3	Eva	(987 456 312)	F. Lorca 2, Utiel

Record

1st NF Transformation: Multi-valued attribute

R has an attribute which is a set of values:

1. Remove the attribute from the relation and define a new relation with the attribute and the primary key of R.

2. Analyze the functional dependencies of the new relation to define its <u>primary key</u>.

Supplier

vcod	name	telephone	address
V1	Pepe	(96 3233258, 964 523844, 979 568987, 987 456123)	Paz 7, Valencia
V2	Juan	(96 3852741, 910 147258)	Eolo 3, Castellón
V3	Eva	(987 456 312)	F. Lorca 2, Utiel

vcod	name	address
V1	Pepe	Paz 7, Valencia
V2	Juan	Eolo 3, Castellón
V3	Eva	F. Lorca 2, Utiel

vcod	telephone	PK?
V1	96 3233258	
V2	96 3852741	
V3	987 456 312	
V1	964 523844	
V1	979 568987	
V1	987 456123	
V2	910 147258	

```
Supplier (vcod, name, telephone, address)
    PK: {vcod}
        Supplier (vcod, name, address)
             PK: {vcod}
         Phonebook (vcod, telephone)
                                               If a telephone cannot be shared:
             PK: {telephone}
                                               {telephone} → {vcod}
             FK: \{vcod\} \rightarrow Supplier
             NNV: {vcod}
```

```
Supplier (vcod, name, telephone, address)

PK: {vcod}

Supplier (vcod, name, address)

PK: {vcod}

Phonebook (vcod, telephone)

PK: {telephone, vcod} 

FK: {vcod} → Supplier
```

1st NF Transformation: Composite attribute

R has a composite attribute (a record).

remove the attribute and add a <u>new attribute</u> for each member of the composite attribute

Example 1

vcod	name	address
V1	Pepe	Paz 7, Valencia
V2	Juan	Eolo 3, Castellón
V3	Eva	F. Lorca 2, Utiel

vcod	name	street	number	city
V1	Pepe	Paz	7	Valencia
V2	Juan	Eolo	3	Castellón
V3	Eva	F. Lorca	2	Utiel

```
Supplier (vcod, name, telephone, address)

PK: {vcod}

Supplier (vcod, name, street, number, city)

PK: {vcod}

Phonebook (vcod, telephone)

PK: {telephone, vcod}

FK: {vcod} → Supplier
```

2nd NF

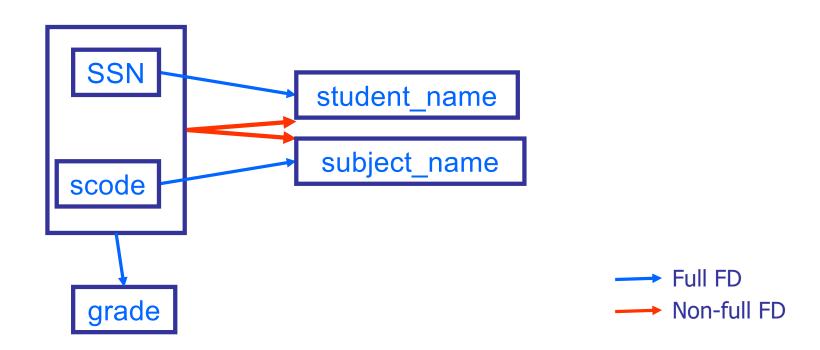

A relation R is in 2NF if it is in 1NF and all non-prime attributes have a full functional dependency on all the keys of *R*.

Problems of relations which are not in 2NF:

- Redundancy.
- It is more difficult to insert, delete, and update

PK: {SSN, scode}

SSN	student_name	scode	subject_name	grade
1	Pepe	DBD	Diseño de BD	6
1	Pepe	BDA	Bases de Datos	7
2	Juana	DBD	Diseño de BD	7
2	Juana	BDA	Bases de Datos	5

2nd NF Transformation

The primary key has more than one attribute and there is some non-prime attribute which does not fully functionally depend on the primary key

Divide the relation into several relations to remove the not fully functional dependency

SSN	student_name	scode	subject_name	grade
1	Pepe	DBD	Diseño de BD	6
1	Pepe	BDA	Bases de Datos	7
2	Juana	DBD	Diseño de BD	7
2	Juana	BDA	Bases de Datos	5

SSN	student_name
1	Pepe
2	Juana

SSN	scode	grade
1	DBD	6
2	BDA	7
1	DBD	7
2	BDA	5

scode	subject_name
DBD	Diseño de BD
BDA	Bases de Datos

```
Final_grade (SSN, scode, student_name, subject_name, grade)
   PK: {SSN, scode}
         Student (SSN, student name)
             PK: {SSN}
       Subject (scode, subject_name)
             PK: {scode}
         Final grade (SSN, scode, grade)
             PK: {SSN, scode}
             FK: \{SSN\} \rightarrow Student
             FK: {scode} → Subject
```

```
Wrote (ssn: char(4), name: varchar(50), ISBN: char(25), title: varchar(50),
                 euros: float)
   PK: {ssn, ISBN}
Partial dependencies on the PK:
        \{ssn\} \rightarrow \{name\}
        \{ISBN\} \rightarrow \{title\}
2<sup>nd</sup> NF:
Wrote (ssn: char(4), ISBN: char(25), euros: float)
   PK: {ssn, ISBN} FK:{ssn} -> Author
                                                     FK:{ISBN} -> Book
Author ( ssn: char(4), name: varchar(50) )
   PK: {ssn}
Book ( ISBN: char(25), title: varchar(50))
   PK: {ISBN}
```

3rd NF

A relation R is in 3NF if it is in 2NF and there are no functional dependencies between any non-prime attribute.

Problems of relations which are not in 3NF:

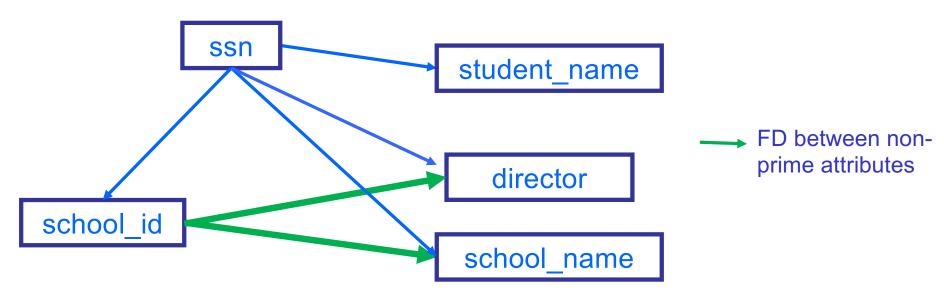

- Redundancy.
- It is more difficult to insert, delete, and update

Transitive dependency

 $A = \{A_1, A_2, ..., A_n\}$ is the set of attributes of R, If $\{A_i\} \rightarrow \{A_j\}$ and $\{A_j\} \rightarrow \{A_k\}$ then $\{A_i\} \rightarrow \{A_k\}$ is a **transitive dependency** (A_k) is transitively dependent on A_i via A_i)

ssn	student_name	school_id	school_name	director
1	Olga	ETSINF	Escuela de Informática	Pepe
2	Juana	ETSINF	Escuela de Informática	Pepe
3	Ana	ED	Escuela de Diseño	Eva
4	Juan	ED	Facultad de Diseño	Eva

PK: {ssn}

3rd NF Transformation

If there is at least one pair of non-prime attributes which are dependent

Remove the dependent attribute and create a new table with it and the determinant attribute. The PK of the new table will be the **determinant** attribute

Student

PK:	{ssn}
·	

snn	student_name	school_id	school_name	director
1	Olga	ETSINF	Escuela de Informática Pepe	
2	Juana	ETSINF	INF Escuela de Diseño Pe	
3	Ana	ED	Escuela de Diseño Ev	
4	Juan	ED	Escuela de Diseño	Eva

Student

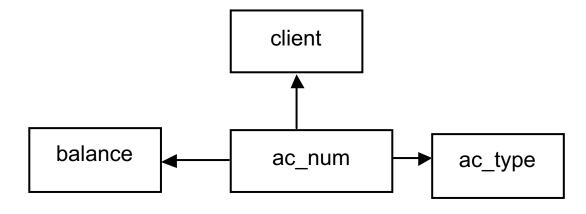

snn	student_name	school_id
1	Olga	ED
2	Juana	ETSINF
3	Ana	ED
4	Juan	ED

School

school_id	school_name	director
ED	Escuela de Diseño	Pepe
ED	Escuela de Diseño	Eva

```
Student (ssn, student_name, school_id, school_name, director)
   PK: {ssn}
      Student (ssn, student_name, school_id)
            PK: {ssn}
            FK: {school_id} → School
        School (school_id, school_name, director)
            PK: {school id}
```

In the **Account** table all the attributes functionally depend on the PK and there are no dependencies between non-prime attributes, so it is in **3NF**:

It is not in 3NF, because there is a FD between non-prime attributes

Consider the following relational schema:

```
R (A: integer, B: varchar, C: integer, D: varchar, E: varchar, F: varchar, G: varchar)
PK: {A, B}
NNV: {C, D, E, F, G}
```

and the following functional dependencies

$$\{G\} \rightarrow \{E\} \hspace{1cm} \{G\} \rightarrow \{F\} \hspace{1cm} \{A\} \rightarrow \{D\} \hspace{1cm} \{A\} \rightarrow \{G\}$$

Transform the schema to obtain a set of relations in 3NF

```
R (A: integer, B: varchar, C: varchar, D: varchar, E: varchar, F: varchar, G: varchar)
   PK: {A, B}
   NNV: {C, D, E, F, G}
 \{G\} \rightarrow \{E\} \{G\} \rightarrow \{F\} \{A\} \rightarrow \{D\}
                                                                             \{A\} \rightarrow \{G\}
   Transitive dependencies:
              If \{A\} -> \{G\} and \{G\} -> \{E\}
              If \{A\} -> \{G\} and \{G\} -> \{F\}
2FN
\{G\} \rightarrow \{E\} \qquad \{G\} \rightarrow \{F\} \qquad \{A\} \rightarrow \{D\} \qquad \{A\} \rightarrow \{G\} \qquad \{A\} \rightarrow \{E\} \qquad \{A\} \rightarrow \{F\}
           R1(A: integer, B: varchar, C: integer)
             PK: {A, B}
             FK:{A} -> R21
             NNV: {C}
           R21 (A: integer, D: varchar, G: varchar, E: varchar, F: varchar)
             PK: {A}
             NNV: {D,G, E, F}
           All the values of {A} in R21 are also in R1.
```

```
R21 (A: integer, D: varchar, G: varchar, E: varchar, F: varchar)
   PK: {A}
                                                             R1(A: integer, B: varchar, C: integer)
   NNV: {D,G, E, F}
                                                                PK: {A, B}
                                                                FK:{A} -> R21
  All the values of {A} in R21 are also in R1.
                                                                NNV: {C}
  3FN
  \{G\} \rightarrow \{E\} \{G\} \rightarrow \{F\} \{A\} \rightarrow \{D\} \{A\} \rightarrow \{G\} \{A\} \rightarrow \{E\} \{A\} \rightarrow \{F\}
  R1(A: integer, B: varchar, C: varchar)
    PK: {A, B}
    FK:{A} -> R21
    NNV: {C}
  R21 (A: integer, D: varchar, G: varchar)
    PK: {A}
    FK:{G} -> R31
    NNV: {D,G}
  R31 (G: integer, E: varchar, F: varchar)
                                                  All the values of {A} in R21 are also in R1.
    PK: {G}
                                                  All the values of {G} in R31 are also in R21.
    NNV: {E, F}
```

Consider the following relational schema:

```
R (A: char, B: int, C: int, D: char, E: int, F: int, G: char, H: int) PK: {A, B, C} NNV: {D, E, F, G, H}
```

From the dependencies shown below, transform the relation into a set of relations in third normal form (3NF).

$$\{A,C\} \rightarrow \{E\} \qquad \{B\} \rightarrow \{D\} \qquad \{B\} \rightarrow \{G\} \qquad \{E\} \rightarrow \{H\} \qquad \{D\} \rightarrow \{F\}$$

2FN

```
R (A: char, B: int, C: int, D: char, E: int, F: int, G: char, H: int)
                                     PK: {A, B, C}
                                                                                                                                                                                                                                                                                                                 NNV: {D, E, F, G, H}
                   \{A,C\} \rightarrow \{E\} \{B\} \rightarrow \{D\} \{B\} \rightarrow \{G\} \{E\} \rightarrow \{H\} \{D\} \rightarrow \{F\}
Transitive dependencies: If \{A,C\} \rightarrow \{E\} and \{E\} \rightarrow \{H\}
                                                                                                                                                                                                                                                                                If \{B\} \rightarrow \{D\} and \{D\} \rightarrow \{F\}
     \{A,C\} \rightarrow \{E\} \quad \{A,C\} \rightarrow \{H\} \quad \{B\} \rightarrow \{D\} \quad \{B\} \rightarrow \{G\} \quad \{B\} \rightarrow \{F\} \quad \{E\} \rightarrow \{H\} \quad \{D\} \rightarrow \{F\} \quad \{B\} \rightarrow 
      R1 (A: char, B: int, C: int)
                                     PK: {A, B, C}
                                     FK:\{A,C\} \rightarrow R21(A,C)
                                                                                                                                                                                                                                                                                                                                                                         FK:\{B\} \rightarrow R22(B)
      R21 ( A: int, C: int, E: int, H: int)
                                          PK: {A, C} NNV: {E, H}
      R22 (B: char, D: char, F: int, G: char)

                                     All the pairs of values of {A.C} in R21 are also in R1
                                     All the values of {B} in R22 are also in R1
                                     All the values of {E} in R31 are also in R21
```

All the values of {D} in R32 are also in R22.

121

Consider the following relational schema:

```
R (A: char, B: char, C: int, D: char, E: int, F: char, G: int, H: char) PK: {A, B, C} NNV: {D, E, F, G, H}
```

From the dependencies shown below, transform the relation into a set of relations in third normal form (3NF).

$$\{A\} \rightarrow \{D\} \qquad \{B,C\} \rightarrow \{E\} \qquad \{E\} \rightarrow \{F\} \qquad \{G\} \rightarrow \{H\}$$

2FN

```
R (A: char, B: char, C: int, D: char, E: int, F: char, G: int, H: char)
                     NNV: {D, E, F, G, H}
    PK: {A, B, C}
  \{A\} \rightarrow \{D\} \{B,C\} \rightarrow \{E\} \{E\} \rightarrow \{F\} \{G\} \rightarrow \{H\}
Transitive dependencies: If \{B,C\} \rightarrow \{E\} and \{E\} \rightarrow \{F\}
\{A\} \rightarrow \{D\} \{B,C\} \rightarrow \{E\} \{E\} \rightarrow \{F\} \{G\} \rightarrow \{H\} \{B,C\} \rightarrow \{F\}
R1 (A: char, B: char, C: int, G: int, H: char, )
    PK: {A, B, C} NNV: {G, H}
    FK:\{A\} \rightarrow R21(A) FK:\{B,C\} \rightarrow R22(B,C)
R21 ( A: char, D: char)
    PK: {A} NNV: {D}
R22 (B: char, C: int, E: int, F: char)
    PK: {B,C} NNV: {E, F}
```

All the values of {A} in R21 are also in R1.
All the pairs of values of {B.C} in R22 are also in R1.

3FN

```
R1 (A: char, B: char, C: int, G: int, H: char, )
                                                                 R21 ( A: char, D: char)
   PK: {A, B, C} NNV: {G, H}
                                                                 PK: {A} NNV: {D}
   FK:\{A\} \rightarrow R21(A) FK:\{B,C\} \rightarrow R22(B,C)

                                    All the pairs of values of {B,C} in R22 are also in R1.
```

All the values of {E} in R31 must be in {E} of R22

All the values of {G} in R32 must be in {G} of R1

124

Consider the following relational schema:

```
R (A: int, B: char, C: char, D: set of integers, E: int, F: text, G: int, H: int)

PK: {A, B, C}

NNV: {D, E, F, G, H}
```

From the dependencies shown below, transform the relation into a set of relations in third normal form (3NF).

$$\{B\} \rightarrow \{G\} \qquad \qquad \{A,\ B\} \rightarrow \{F\} \qquad \qquad \{G\} \rightarrow \{H\}$$

3FN

```
R (A: int, B: char, C: char, D: set of integers, E: int, F: text, G: int, H: int)
          PK: {A, B, C} NNV: {D, E, F, G, H}
          \{B\} \rightarrow \{G\} \{A, B\} \rightarrow \{F\}
                                                             \{G\} \rightarrow \{H\}
       R (A: int, B: char, C: char, E: int)
