- Keep the exam sheets stapled.
- Write your answer inside the reserved space.
- Use clear and understandable writing. Answer in a brief and precise way.
- The exam has 10 questions, every one has its score specified.
- 1. Consider a program that contains a function f that prints the address of visible objects (local, global, and dynamic variables or functions) and the process memory map. Along its execution it displays a memory map made of 12 regions as shown below:

/* Source code */	Memory map at program comment /* Show map */
#include <	<b>a</b> 08048000-08049000 r-xp 00000000 00:14 5374410 /home/m/programa
float x;	<b>b</b> 08049000-0804a000 rp 00000000 00:14 5374410 /home/m/programa
void * p;	<b>c</b> 0804a000-0804b000 rw-p 00001000 00:14 5374410 /home/m/programa
	<b>d</b> 09cbe000-09cdf000 rw-p 00000000 00:00 0 [heap]
<pre>void f(int k){</pre>	<b>e</b> b7524000-b76c8000 r-xp 00000000 08:06 291538 /lib/i386-linux-gnu/libc-2.15.so
int L;	<b>f</b> b76c8000-b76ca000 rp 001a4000 08:06 291538 /lib/i386-linux-gnu/libc-2.15.so

- **2.** Let consider a system with 512 MB of logical addressing space, with 4 KB page size and with 64 MB of physical memory.
- a) If memoy is managed by paging, with a maximum number of 4 pages per process, the following translation between logical and physical addresses has been done along the execution of process A:.

Logical addr	10185	28	14050	7248
Physical addr	1845193	102428	5858	27728

From the former information fill the page table of process A.

b) Describe the logical address format if **segmentation with paging** is applied with a maximum of 32 segments per process.

Departamento de Informática de Sistemas y Computadoras (DISCA)

c) In the previous **segmentation with paging** model, and considering the following page table of segment 1 for a given process, obtain the logical addresses that correspond to physical addresses 8220 and 25096 in that process.

	Segment 1 page	table
	Frame	Valid bit
0	4	Valid
1	5	Valid
2	6	Valid
3	2	Valid

**3.** In relation to page faults in a system with virtual memory, indicate if every one of the following statements are true(T) or false(F). (**Note.** One error voids one correct answer)

0,75 points

3	T/F	
		When a process requests a new page to expand the stack always happens a page fault,
		regardless of having or not free frames to allocate it.
		There is a page fault when is accessed a page that is still in the frame reservation pool.
		A page fault happens when a process access the first time to a page of code or data that is not
		allocated in physical memory
		Page faults only happen when there are no free frames in physical memory to allocate a new
		page.
		A page fault always involves writing one page from memory to disk and reading one page from
		disk to memory.

Departamento de Informática de Sistemas y Computadoras (DISCA)

- **4.** Let consider a virtual memory system with **two levels of paging** and the following features:
- 24 bit logical addresses and 22 bit physical addresses
- 4 Kbyte page size
- 16 entries in the first level page table
- OPTIMAL replacement algorithm and LOCAL scope
- 4 frames is the máximum number of frames that a porcess can get

Now there is process P in memory that uses frames 0 to 3, as shown in the following figure, being p1 and p2 the page indexes to first and second level, repectively.

Frame	p1, p2	
0	(0x8,0x18)	<b>Note</b> . Notation 0x, means
1	(0x8,0xDA)	hexadecimal
2	(0x3,0x85)	
3	(0xB,0x15)	

- a) Obtain the logical address and physical address formats, specifying the total number of bits and the number of bits per field.
- b) Suppose that from the time instant shown in the table, the CPU references the following sequence of process P addresses: 0x154891 0x385F94 0x8DA122 0xB15679 0xB15A8C, 0x3851E9, 0x36C98A, 0x154917 0x1541CB, 0x385A03, 0x385545, 0x2F223C, 0x2F2B21, 0x1546F5. Show the evolution of the physical memory content and obtain the number of page faults.

Departamento de Informática de Sistemas y Computadoras (DISCA)

**5.** Let consider a system with 16 Mbyte of physical memory, 20 bit logical addresses, pages of 4 Kbytes and **demand paging**. It uses SECOND CHANCE with LOCAL SCOPE as replacement algorithm. The system assigns 3 frames to every process. Now the frame assignment and the physical memory state for processes A and B, that are being executed, are the ones shown in the following tables:

Frame	Process	Page	Reference bit
0x003	A	0xA5	1
0x004	A	0x24	0
0x005	A	0x6E	1

Frame	Process	Page	Reference bit
0x009	В	0x9A	0
0x00A	В	0x27	1
0x00B	В	0x3F	0

From that instant the following sequence of logical addresses are accessed (A, 0x24350) (A, 0x9A000) (B, 0x3A120) (A, 0x99050) (B, 0x3A650) (B, 0x28495) (A, 0x6E350). In the beginning the searching for a victim, for every process, matches the increasing order of the frame id allocated to every processes. Show the evolution of the memory frames involved filling the following table:

1,0 point

Frame	Init page   Ref bit	Referenced page id						
0x003								
0x004								
0x005								
0x009								
0x00A								
0x00B								

Total number of page faults =

Departamento de Informática de Sistemas y Computadoras (DISCA)

**6.** In a time sharing system where processes A and B have been executed, a meassurement was done of the sequence of page references that the CPU has performed, getting the following result:

Time	0	1	2	3	4	5	6	7	8	9	10	11
Proc,page	A1	В2	A3	В4	A2	В1	A5	В6	A2	В1	A2	В3

Time(cont)	12	13	14	15	16	17	18	19
Proc,page	Α7	В6	A3	В2	A1	В2	A3	В6

Considering a working set window of 4, obtain the working set for A and B in t = 6, t = 10, t = 14 and t = 19.

0,5 points

6			
	Time	Working set	
	t=6		
	t=10		
	t=14		
	t=19		

7. The following listing correspond to the content of a directory in a UNIX system:

drwxr-xr-x	2 peter	users	4096 sep 8	2012 .
drwxr-xr-x	8 peter	users	4096 dec 10	14:39
-rwsrw-r-x	1 peter	users	9706 sep 9	2012 append
-rw-rw-r	1 peter	users	4310 sep 9	2012 fl
-rrw-r	1 peter	users	4157 sep 9	2012 f2
lrwxrwxrwx	1 peter	users	6 sep 9	2012 new->append

Where program "append" appends the content of a file specified as the first argument to another file specified as the second argument. Let's consider the following command:

\$ append f1 f2

Indicate if the following statements about it are true(T) of false(F):

Note. One error voids a correct answer.

(0,75 points)

7	T/F				
		User <i>john</i> that belongs to group <i>students</i> can not start the execution of file "append"			
		User mary that belongs to group users can start the execution of file "append" but			
		she will get an error when the process "append" will try to write in file f2			
		The two users mentioned above, <i>john</i> and <i>mary</i> , will execute the command			
		successfully			
		User <i>peter</i> that belongs to group <i>users</i> will execute the command successfully			
		If the following permissions are set for file "append": -rwxrwsr-x (the SETGUID			
		bit is set) then user <i>john</i> will execute the command successfully			

Departamento de Informática de Sistemas y Computadoras (DISCA)

#### FSO EEE2 Exam December 16th, 2013

**8.** Given the following C code, obtain the content of the file descriptor tables in the code points marked as /\* Point 1 \*/, /\* Point 2 \*/ and /\* Point 3 \*/ for every active process in each point. Obtain also the values of variables fd1, fd2, fd3, fd[0] and fd[1] if they are meaningful.

```
/* C code */
.......
fd1=open("f1",...);
close(STDOUT_FILENO);
fd2=open("f2",...);
dup2(fd1,STDERR_FILENO); /* Point 1 */
dup(STDERR_FILENO);
dup(STDIN_FILENO);
fd3=open("f3",...); /* Point 2 */
if (fork()==0) {
   dup2(fd3, STDIN_FILENO);
   close(fd1);
}
close(fd2);
pipe(fd); /* Point 3 */
.....
```

Departamento de Informática de Sistemas y Computadoras (DISCA)

**9.** The following program sorts a list of numbers by calling program *sort* and using redirections and pipes. The column on the right shows the result of a successful execution.

/* C code */	/* Execution result */
#include "the required ones"	Before:
<pre>int main(int argc, char *argv[]) {</pre>	4
<pre>int backup, fd[2];</pre>	3
char list[]=" 4 \n 3 \n 1 \n 2 \n";	3
	1
<pre>pipe(fd);</pre>	2
<pre>printf("Before:\n %s After:\n", list);</pre>	After:
if (fork()==0){	1
dup2 (,);	2
close ( ); close ( );	3
execlp("sort", "sort", NULL);	
} else {	4
backup=dup(STDOUT_FILENO);	That's all
dup2 (,);	
close (); close ();	
1 . 5 (	
<pre>printf("%s", list);</pre>	
dup2 (backup, STDOUT_FILENO);	
wait(NULL);	
<pre>printf("That's all \n");</pre>	
}	
return 0;	
}	

- a) Complete the parameters of dup2 and close to get the desired program behaviour.
- b) Explain what is the purpose of variable backup.
- c) Explain what will happend if lines are changed in the proposed code as follows:

/* Initial code */	/* New code */
<pre>dup2 (backup, STDOUT_FILENO); wait(NULL); printf("That's all \n");</pre>	<pre>dup2 (backup, STDOUT_FILENO); printf("That's all \n"); wait(NULL);</pre>
	•••

d) Explain what will happend if lines are changed in the proposed code as follows:

/* Initial code */	/* New code */
<pre> dup2 (backup, STDOUT_FILENO); wait(NULL); printf("That's all \n");</pre>	<pre>wait(NULL); dup2 (backup, STDOUT_FILENO); printf("That's all \n");</pre>
	··· ·

```
a) To be completed
 if (fork()==0){
   dup2 (
                             );
   close (
                    );
   close (
                    );
   execlp("sort", "sort", NULL);
 } else {
   backup=dup(STDOUT_FILENO);
   dup2 (
                             );
   close (
                    );
   close (
                    );
 }
b)
c)
d)
```

**10.** A 6 GBytes partition if formated with a MINIX file system with the following parameters:

- 1 block = 1 KByte
- 1 zone = 1 block
- 64 byte i-node with 32 bit pointers to zone (7 direct, 1 indirect and 1 double indirect)
- 32 bit directory entrie
- 8192 i-nodes
- File system organization as follows:

Boot block	Super block	i-node bit map	Zone bit map	i-nodes	Data area
------------	-------------	----------------	--------------	---------	-----------

- a) Compute the number of blocks in the i-node bit map, the zone bit map, the i-nodes area and the data area.
- b) In this file system the root directory contains:
  - o 2 regular files reg1 y reg2 of 10 Kbyte each one
  - o 1 directory dir that itself contains a regular file reg3 of 10 Kbyte
  - b1) Explain how may zones are used by every one of the former files and what type of information contain those zones.
- b2) Explain the total number of occupied i-nodes in this file system and the value of the field "Number of links" in every occupied i-node.
