SURNAME	NAME	Group
IDN	Signature	E

- Keep the exam sheets stapled.
- Write your answer inside the reserved space.
- Use clear and understandable writing. Answer in a brief and precise way.
- The exam has 10 questions, everyone has its score specified.
  - 1. In a system with **contiguous allocation** memory management with **variable partitions**, the memory state at a given moment in time is the following:

(	י י					2048	K -1
	P3 1024KBytes	Free 64KBytes	P2 128KBytes	P1 256 KBytes	Free 512KBytes	P4 64 KBytes	

- a) What is the content of MMU registers that allow the translation of logical addresses sent by the CPU for processes P1, P2, P3 and P4, into physical addresses?
- b) Supposing that the free gaps list is ordered from lower to higher addresses, indicate in what free gap will be allocated a new process of 28Kbyte size for every one of the allocation strategies: Best Fit, Worst Fit and First Fit.
- c) Explain if in that type of system there could be external and/or internal fragmentation.

2. In a system with 1 GByte of main memory and a logical space of 4GByte a memory manager with **three levels of paging** is going to be implemented. The first level tables have 16 page descriptors and the tables for  $2^{nd}$  and  $3^{rd}$  levels have the same number of page descriptors. The page size is 16Kbyte, and the page descriptor size is always 8Byte.

Explain your answer to the following questions:

- a) Logical and physical address formats, indicating the composing fields and their number of bits.
- b) Size of the page tables at every level and maximum number of tables at every level.
- c) If a 16Mbyte process is allocated in main memory, indicate the number of page descriptors that will be used in order to address all the process' pages.

**3.** In a time sharing system that at a given moment in time is running three processes (A, B y C), a working set model has been implemented in order to avoid thrashing, with a working set window size of 5. Consider the following sequence of page references and the marked instants  $t_1$  and  $t_2$ :

A2	B4	В3	C2	A6	C2	C1	B2	B4	B1	A2	A1	C2	B1	A4	C3
															<b>↑</b>
															$t_1$
A2	B1	A3	A4	C6	B0	B5	A2	A3	B1	C7	C2	A2	A2	B1	B4
															<b>1</b>
															$t_2$

Explain if every one of the following statements are correct or false:

- a) The working set of processes A, B and C at  $t_1$  is :  $WS_{t1}(A) = \{1,4\}$ ,  $WS_{t1}(B) = \{1\}$ ,  $WS_{t1}(C) = \{2,3\}$
- b) The size of process A working set at  $t_2$  is 3 (WSS<sub>t2</sub>(A)=3)
- c) If there are 11 frames available along all-time instants we can be sure that there won't be thrashing.

EEE2 December, 22th 2014

4. The OS of a given computer manages virtual memory by means of paging with pages of 4KByte size.
The logical addressing space is 64MB and the physical is 1MB. Free frames are allocated globally
following the increasing order of physical addresses, beginning from address 0x11000

a) Explain	the	format	of	logical	and	physical	addresses,	with	their	fields	and	number	of	bits	per
field.															

b) Two processes Y	and Z perform the fo	ollowing sequence of	of logical addres	ses (all the n	umbers are
hexadecimal):					

Y:1008C24, Y:1008C28, Y:2007143, Y:1008C2C, Y:2007157, Z:1008C24, Z:1008C28, Z:1008C2C, Z:200A100, Z:200B012, Y:2007158, Y:1009000, Y:1009004, Y:2007158, Y:1009008, Z:1008C30, Z:200A017, Z:1058120, Z:1058124, Z:200B012

Obtain the reference string that corresponds to that access sequence.

c) Obtain the content of the page tables for both processes, including only the page descriptors of referenced pages. (Suppose that there are enough free frames to allocate all the referenced pages).

5. In a system that manages virtual memory by means of paging, the following reference string is generated when executing processes Y and Z (page ids in hexadecimal, left side zeros omitted): Y:108, Y:207, Z:119, Z:20A, Y:207, Y:108, , Z:20A, Y:207, Z:20B

In case of the system having only 3 frames available from 0 to 2, initially empty, answer the following questions:

- a) Obtain the physical memory content evolution and the number of page faults when applying a replacement algorithm **LRU** with global replacement.
- b) Obtain the physical memory content evolution and the number of page faults when applying a replacement algorithm **Second Chance with global replacement**.

- **6.** Suppose that the following code for *redir.c* is executed without errors and that file "*listing.txt*" doesn't exist, then answer the following questions:
  - a) Obtain the content of the file descriptor tables at /\*\*\*(1) Descriptors table \*\*\*/ and /\*\*\*(2) Descriptors table \*\*\*/ for every process that reaches those lines along its execution.
  - b) Explain what is shown on the screen whe *redir.c* code is executed and the equivalent shell commands.
  - c) Explain what would happen when executing *redir.c* code removing the wait() call from the program.

```
/***** redir.c code *****/
#include <all required.h>
#define NEWFILE (O_WRONLY | O_CREAT | O_TRUNC)
#define MODE644 (S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)
#define FILE "listing.txt"
int main(int argc, char *argv[]) {
  int fd;
  if (fork() == 0) {
    if ((fd = open(FILE, NEWFILE, MODE644)) == -1)
      exit(-1);
    dup2(fd, STDOUT_FILENO);
    close (fd);
    /***(1)Descriptors table ***/
    execlp("ls", "ls", "-la", NULL);
    fprintf(stderr, "Execution failed ");
    exit(1);
  wait(NULL);
  if ((fd = open(FILE, O_RDONLY)) == -1)
   exit(-1);
  dup2 (fd, STDIN_FILENO);
  /***(2)Descriptors table***/
  close (fd);
  execlp("wc", "wc", NULL);
  fprintf(stderr, "wc execution failed ");
  exit(1);
```

Departamento de Informática de Sistemas y Computadoras (DISCA) **EEE2** December, 22th 2014

7. The tee filter does a copy in the standard output of one or more files, for instance the command: \$\\$\\$\sis -la \ \ \ \ tee \ listing.txt

Shows on the screen the listing of the working directory and also copies it to file *listing.txt*.

The code (incomplete) of a command named mitee in shown next. This command needs: a first parameter that is the output file and one or more parameters that are interpreted as a command to be executed with its parameters. The final effect is that mitee executes the command specified, making a copy of the command standard output in the specified file. For instance,

```
$mitee listado.txt ls -la
```

Will do the same as executing  $$ls - la \mid tee \ listing.txt.$  In the code provided, the output duplication is made in function  $tee\_out$  copying from the input on the standard output into the output file.

a) Obtain the file descriptors that correspond to tags numbered as \*\*1\*\* to \*\*8\*\* in function main.

b) Obtain the file descriptors that correspond to tags numbered as \*\*9\*\* to \*\*11\*\*.

```
#include <all required.h>
#define NEWFILE (O_WRONLY | O_CREAT | O_TRUNC)
#define MODE644 (S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)
void tee_out(const char *file_name) {
  int fdout, count;
  char buf[10];
  if ((fdout = open(file_name, NEWFILE, MODE644)) == -1)
    exit(-1);
  while ((count= read(**9**, buf, sizeof(buf)))>0) {
    if (write(**10**, buf, count) != count) {
      fprintf(stderr,"Write error STDOUT_FILE\n");
      exit(-1);
    if (write(**11**, buf, count) != count) {
      frintf(stderr,"Write error FILE\n");
      exit(-1);
  close(fdout);
  exit(1);
int main(int argc, char *argv[]) {
  int fd[2];
  if (argc < 3) {
    fprintf(stderr, "Arguments error\n");
    exit(-1);
 pipe(fd);
  if (fork() == 0) {
    dup2(**1**,**2**);
    close(**3**); close(**4**);
    tee_out(argv[1]);
  dup2 (**5**,**6**);
  close(**7**); close(**8**);
  execvp(argv[2], &argv[2]);
  fprintf(stderr, "Execution failure of %s", argv[2]);
  exit(1);
```

**8.** In a Linux file system the listing of a directory content is the following: total 3216

drwxr-xr-x	38 pau	admin	1292	12	dic	18:46	•
drwxr-xr-x	11 pau	admin	374	9	dic	16:51	
drwxr-x	32 pau	admin	1088	11	dic	16:35	fig
-rw-rr	1 pau	admin	6616	12	dic	09:46	data.txt
-rwsr-xr-x	1 pau	admin	201	12	dic	09:45	reader
-rw-r-sr	1 pau	admin	889	12	dic	09:45	writer
-rw-rr	2 pau	admin	44507	12	dic	09:46	log

Suppose that the users in the following table start a session on the system and they try to execute the commands shown also on the table, when the working directory is the one that give the former listing. Indicate the effective UID and GID when the command starts its execution and if the operating system will allow the execution and the required access to the files and directories involved in the command. reader and writer are executable files that take as argument a file name; reader opens the file for reading and writer for writing. Commands cat y cp are the common ones from the shell, with usual accessibility and permissions.

(1,0 points)

8	User	Group	Command	Execution allowed?	eUID	eGID	Access allowed to files and directory?
	valero	admin	cp data.txt fig				
	pau	admin	writer data.txt				
	boi	sports	cat data.txt				
	boi	sports	reader data.txt				
	boi	sports	writer data.txt				

**9.** Considering that the number of links of file *log* is two (2nd column in the listing) and that its size is 44507 Bytes, explain the amount of disk space that will be released when *pau* executes command: \$ rm log

	(0,5 points)

Departamento de Informática de Sistemas y Computadoras (DISCA)

10. A disk with 512 MBytes of capacity is formated with a MINIX version with the following structure:

Boot block	Super block	i-node bit map	Zone bit map	i-nodes	Data area

The sizes and values used are the following:

- 32-Byte i-node: 7 direct pointers, 1 indirect and 1 double indirect
- 16-bit zone pointer
- 16-Byte directory entries
- 1 Block = 1KByte
- 1 zone =  $2^3$  blocks = 8KByte
- Number of i-nodes: 8.192

Answer the following items:

- a) Obtain the number of blocks required for the i-node bit map, the zone bit map and the i-nodes.
- b) In this system there have been created 10 directories (including the root directory), 250 regular files, 20 symbolic links and 40 hard links to already existing regular files. Explain the number of i-nodes that will be marked as busy.
- c) In the root directory there are 3 directories, 10 regular files and 5 hard links to regular files. Explain the value of the field "number of links" in i-node = 1.

(1,5 points= 0,75+0,5+0.5)

10 a)

b)
